2001Br35: E=210 MeV ^{48}Ca beam from the ALPI Linac accelerator at the INFN Legnaro Laboratory. γ rays were detected with the GASP array. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin. Deduced levels, J, π .

\dagger From a least-squares fit to γ -ray energies, assuming $\Delta E\gamma=0.5$ keV for values with one decimal and 1 keV for integer values.

\ddagger From Adopted Levels.

2001Br35 suggest that these states are near yrast states with $J>5$ and must involve two-particle two-hole core excitations, which is manifested by their large energy separation from lower lying states.
