
$^{10}\text{B}(\text{Ca},\text{2p}\gamma)$, $^{40}\text{Ca}(\text{B},\text{2p}\gamma)$ **1994Ca04,1973Hu08**

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Jun Chen	NDS 179, 1 (2022)	30-Nov-2021

Also includes $^{40}\text{Ca}(^{12}\text{C},3\text{p}\gamma)$ from [1973Hu08](#).

[1994Ca04](#): $^{10}\text{B}(\text{Ca},\text{2p}\gamma)$ E=150 MeV ^{40}Ca beam was produced from the Daresbury Nuclear Structure Facility. Target was ^{10}B .

Fragments were separated with the Daresbury 0° recoil separator. γ rays were detected with the escape-suppressed HPGe detector array (19 detectors in 4 rings at 40° , 101° , 117° , and 143° to the beam direction). Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, γ anisotropies. Deduced levels, J , π , band structures, γ -ray multipolarities.

[1973Hu08](#) (also [1972BiZG](#)): $^{40}\text{Ca}(\text{B},\text{2p}\gamma)$ E=19, 22.5 and 25 MeV ^{10}B beams were produced from the MP Tandem Van de Graaff of Technische Universitat Munchen. Target was $100 \mu\text{g}/\text{cm}^2$ metallic calcium layer sandwiched between a $1 \text{ mg}/\text{cm}^2$ gold backing and a $150 \mu\text{g}/\text{cm}^2$ gold cover. γ rays were detected with two Ge(Li) detectors. Charged particles were detected with an annular silicon counter. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin, $\text{p}\gamma$ -coin, $\gamma(\theta)$, recoil distance. Deduced levels, J , π , $T_{1/2}$, γ -ray multipolarities, transitions strengths. Comparisons with shell model calculations. [1973Hu08](#) also report $\gamma\gamma$ -coin and γ excitation functions from $^{40}\text{Ca}(^{12}\text{C},3\text{p}\gamma)$ with E(^{12}C)=41-62 MeV, but most data are from the $^{40}\text{Ca}+^{10}\text{B}$ reaction.

other:

[2005ChZY](#): $^{10}\text{B}(\text{Ca},\text{2p}\gamma)$ E=110 MeV at ANL. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ -coin.

^{48}V Levels

A $J \geq 7$ state at 1651 keV proposed by [1973Hu08](#) was not confirmed by [1994Ca04](#) or in other studies by [1978MoZZ](#), [1991Ca30](#), and [2002Br42](#). The 396γ assigned to the 1651 level in [1973Hu08](#) is found to deexcite the 2626 level in [1994Ca04](#) and other studies.

 $^{10}\text{B}({}^{40}\text{Ca}, 2\text{p}\gamma), {}^{40}\text{Ca}({}^{10}\text{B}, 2\text{p}\gamma)$ **1994Ca04, 1973Hu08 (continued)**

 ^{48}V Levels (continued)

E(level) [†]	J ^π [@]	Comments
8289.9? ^{‡&} 20	(15,13)	E(level): level not adopted in Adopted Levels. See comment for 2045γ.
8589.0? ^{‡&} 20	(14)	E(level): level not adopted in Adopted Levels. See comment for 2344γ.

[†] From a least-squares fit to γ -ray energies, assuming $\Delta E\gamma=1$ keV where not available.

[‡] The two levels are only proposed by [1994Ca04](#) based on the placement of a single transition from each level. The same transitions are placed differently in other studies ([1991Ca30](#), [2002Br42](#)), which are adopted in Adopted Levels, Gammas.

From RDM in [1973Hu08](#).

[@] From Adopted Levels. Assignments are supported by γ angular anisotropy from [1994Ca04](#) and $\gamma(\theta)$ from [1973Hu08](#) in this dataset.

& Seq.(C): Sequence based on g.s.

^a Band(A): Band based on 1010, 4⁻ state.

^b Band(B): Band based on 520, 1⁻ state.

 $\gamma(^{48}\text{V})$

γ anisotropy given under comments are from [1994Ca04](#); A₂ and A₄ values are from [1973Hu08](#). Expected anisotropy are ≈0.8 for J to J-1 (stretched dipole), ≈1.4 for J to J (dipole), and ≈1.5 for J to J-2 (stretched quadrupole), with the last two indistinguishable in practice ([1991Ca23](#), [1994Ca04](#)).

[†] Values with uncertainties are from 1973Hu08 and those without uncertainties are from 1994Ca04, unless otherwise noted.
Intensity values from 1994Ca04 have been re-normalized to $I_\gamma(627.7\gamma)=100$ (from the 627 level) by the evaluator from the original values which are normalized to 100 for decays to the ground state.

[‡] 1994Ca04 report 1349γ and 1744γ to deexcite the 1976 level, however, these two transitions are not seen in any spectra for ^{48}V in 1994Ca04 but clearly seen and labeled (1349 as 1347) in coincidence spectra for ^{48}Cr , and they are not seen in any other studies for ^{48}V . It is most likely that these two transitions belong to ^{48}Cr .

[#] Stretched ($\Delta J=1$) dipole from angular anisotropy where available (1994Ca04), unless otherwise noted.

 $^{10}\text{B}(^{40}\text{Ca},2\text{p}\gamma), ^{40}\text{Ca}(^{10}\text{B},2\text{p}\gamma)$ **1994Ca04,1973Hu08 (continued)**

 $\gamma(^{48}\text{V})$ (continued)

^a Anisotropy in **1994Ca04** is consistent with dipole ($\Delta J=0$) or stretched quadrupole ($\Delta J=2$); $\Delta J=(2)$ from level scheme.

[&] Multiply placed with intensity suitably divided.

^a Placement of transition in the level scheme is uncertain.
