Full Evaluation	Yang Dong, Huo Junde		NDS 128, 185 (2015)	10-Jul-2015

1970Br07: E=44 MeV, measured $\sigma(E\alpha', \theta)$, rectangular solid-state detectors were used. They were lithium-drifted E-detectors with or without surface-barrier ΔE multi-detectors, between 80 and 400 keV FWHM, DWBA analysis.

1966Me07: E=50 MeV, measured $\sigma(\theta)$, α -particle detected in a unit consisting of four Si(Li) counters fixed at 2° intervals.

1978Ro12: E=15, 18, 19 MeV, measured $\sigma(\theta)$, two solid-state detector telescopes mounted in a 38 cm vertical scattering chamber DWBA analysis.

1990Ba23: E=25 MeV, FWHM: 150-250 keV, measured $\sigma(\theta)$, silicon surface-barriers detectors placed at five equi-spaced positions on each of the two moveable arms of scattering chamber.

1966Pe16: E=42 MeV, FWHM: 105 keV or 60 keV, measured $\sigma(\theta)$. Also quoted in 1996Oa01.

Others: 1965Ta06, 1980PiZS, 1983Co02, 1983Pe10.

All data are from 1970Br07, except as noted.
