1989Po14: E=24.6 MeV; polarized protons; measured $\sigma(\theta)$ and analyzing powers. DWBA analysis.

1980Ho18: E=65 MeV, polarized protons; enriched target (99%); counter telescope, FWHM \approx 200 keV; measured $\sigma(\theta)$ and analyzing powers; DWBA analysis.

1965Sh06: E=28 MeV; isotopic target; counter telescope, overall resolution: \approx 100 keV; measured $\sigma(\text{ED},\theta)$, DWBA analysis.

2001Ku04: E=28 MeV; natural target (91.8% ^{56}Fe); counter telescope, overall resolution: \approx 50 keV; measured $\sigma(\text{ED},\theta)$, DWBA analysis.

For studies of the J dependence of the cross section, see 1962Go16, 1964Sh12, and 1967Gl01.
