

$^{56}\text{Zn } \varepsilon \text{ decay (32.4 ms)}$     [2014Or04](#),[2016Or03](#)

Type	Author	Citation	History Literature Cutoff Date
Full Evaluation	Balraj Singh	ENSDF	25-Mar-2022

Parent:  $^{56}\text{Zn}$ : E=0.0;  $J^\pi=0^+$ ;  $T_{1/2}=32.4$  ms *II*;  $Q(\varepsilon)=13240$  SY; % $\varepsilon+\beta^+$  decay=100.0

$^{56}\text{Zn}$ -T=2;  $T_z=-2$ .

$^{56}\text{Zn}$ - $T_{1/2}$ : From  $^{56}\text{Zn}$  Adopted Levels.

$^{56}\text{Zn}$ - $Q(\varepsilon)$ : 13240 400 (syst, [2021Wa16](#)).

$^{56}\text{Zn}$ -% $\varepsilon+\beta^+$  decay: Measured % $\beta^+$ p=88.5 26 ([2014Or04](#)), authors ascribe missing 11.5% 26 branching to  $\gamma$  decay from 1691 level in analogy with decay of a level in mirror nucleus  $^{56}\text{Co}$ . Adopted %ep=88.0 26 in  $^{56}\text{Zn}$  Adopted Levels, from [2014Or04](#) and [2007Do17](#).

[2016Or03](#), [2014Or04](#) (also conference papers from the same experimental group: [2017RuZX](#), [2016Ru04](#), [2016OrZY](#), [2015Or02](#), [2014Ru08](#), [2014Or03](#), [2014OrZZ](#), [2012OrZY](#)):  $^{56}\text{Zn}$  from fragmentation of  $^{58}\text{Ni}$  beam, E=74.5 MeV/nucleon, on a 200  $\mu\text{m}$  thick natural Ni target at LISE3 facility at GANIL. Fragments were selected by LISE3 separator and implanted into a double-sided silicon strip detector (DSSSD), surrounded by four EXOGAM Ge clovers for  $\gamma$  ray detection; An implantation was defined by simultaneous signals in both a  $\Delta E$  and DSSSD detectors and identified by combining energy loss in  $\Delta E$  and time-of-flight.

Measured  $E\gamma$ ,  $Iy$ ,  $E_p$ ,  $I_p$ ,  $^{56}\text{Zn}$  half-life, proton- $\gamma$  coincidences. Deduced levels,  $J^\pi$ , Fermi and Gammow-Teller strengths. FWHM 70 keV for protons. A total of 8900  $^{56}\text{Zn}$  nuclei was implanted. [2016Ru04](#) is from the same group. Considering the isospin mixing in  $^{56}\text{Cu}$ , observation of  $\gamma$  deexcitation from IAS in competition with much faster allowed proton decay ( $t_{1/2} \approx 1$  as) has been noted as an interesting and puzzling situation. From IMME analysis for T=2 multiplet using mass excess of  $^{56}\text{Fe}$ , and those for the IAS in  $^{56}\text{Ni}$ ,  $^{56}\text{Co}$  and  $^{56}\text{Cu}$ , the last determined from the present work, [2014Or04](#) and [2016Or03](#) conclude that IMME deduced mass excess of  $^{56}\text{Zn}=-25911$  20 agrees better with  $-25730$  260 in [2003Au03](#) than with  $-25580$  500 from [2012Wa38](#). For this reason [2016Or03](#) used  $Q(\varepsilon)$  and  $S(p)$ ( $^{56}\text{Cu}$ ) value from [2003Au03](#). Note that in [2021Wa16](#) and [2017Wa10](#), mass excess for  $^{56}\text{Zn}$  is  $-25390$  400 from systematic trend.

[2016Sm01](#): theoretical analysis of isospin mixing for the decay of  $^{56}\text{Zn}$ ; calculated half-life of  $^{56}\text{Zn}$  g.s.,  $T_z=-1$  energy levels and  $J^\pi$ , lowest  $0^+$  states in  $^{56}\text{Cu}$ , T=2 IAS in  $^{56}\text{Cu}$ ,  $I\beta$  of the IAS, isospin mixing in the IAS, spectroscopic factor for proton emission from  $^{56}\text{Zn}$  decay.

 $^{56}\text{Cu}$  Levels

E(level) <sup>†</sup>	$J^\pi$ <sup>‡</sup>	$T_{1/2}$	Comments
0.0	(4 <sup>+</sup> )	80.4 ms 8	$T_z=-1$ . $J^\pi, T_{1/2}$ : from the Adopted Levels; $J^\pi=4^+$ g.s. in mirror nucleus $^{56}\text{Co}$ .
1414 12	(0 <sup>+</sup> )		$T=1$ $E(p)=831$ 10, $I(p)=3.0$ 4. E(level): this level corresponds to 1450.7, 0 <sup>+</sup> in $^{56}\text{Co}$ mirror nucleus; level from $^{56}\text{Co}$ Adopted Levels in ENSDF database.
1714 12	1 <sup>+</sup>		%p=34 22 ( <a href="#">2014Or04</a> ) $T=1$ Estimated % $\gamma$ =66 22 from this level ( <a href="#">2014Or04</a> ), which probably accounts for 11.5% 26 missing branching ratio. $E(p)=1131$ 10, $I(p)=23.8$ 11. E(level): this level correspondence to 1720.2, 1 <sup>+</sup> in $^{56}\text{Co}$ mirror nucleus; level from $^{56}\text{Co}$ Adopted Levels in ENSDF database.
2560 12	(1 <sup>+</sup> )		%p=100 $T=1$ $E(p)=1977$ 10, $I(p)=4.6$ 8. E(level): this level may correspond to 2635.6, 1 <sup>+</sup> in $^{56}\text{Co}$ mirror nucleus; level from $^{56}\text{Co}$ Adopted Levels in ENSDF database and also from <a href="#">2013Fu15</a> in ( $^3\text{He}, t$ ), although the energy difference of 76 keV 12 seems somewhat large.
2684 12	1 <sup>+</sup>		%p=100 $T=1$ $E(p)=2101$ 10, $I(p)=17.1$ 9. E(level): this level corresponds to 2729.9, 1 <sup>+</sup> in $^{56}\text{Co}$ mirror nucleus, level from $^{56}\text{Co}$ Adopted

**$^{56}\text{Zn}$   $\varepsilon$  decay (32.4 ms) 2014Or04,2016Or03 (continued)** **$^{56}\text{Cu}$  Levels (continued)**

E(level) <sup>†</sup>	J <sup>π‡</sup>	Comments
3446 12	1 <sup>+</sup>	Levels in ENSDF database and also from 2013Fu15 in ( $^3\text{He},t$ ). %p=100 T=1 E(p)=2863 10, I(p)=21.2 10. E(level): this peak is broader in the spectrum than the other peaks. 2014Or04 suggest that this group corresponds to three states at 3432, 1 <sup>+</sup> , and 3496, 1 <sup>+</sup> seen by 2013Fu15 in the mirror nucleus $^{56}\text{Co}$ . In $^{56}\text{Co}$ Adopted Levels in ENSDF database, corresponding two levels are 3436, 0 <sup>+,1<sup>+</sup> and 3510, (0<sup>+</sup>). 2014Or04 included 3527, 0<sup>+</sup> level in <math>^{56}\text{Co}</math> also in this group, but this level is now considered to correspond to the 3531 level in <math>^{56}\text{Cu}</math>.</sup>
3531 12	0 <sup>+</sup>	%p=44 6 (2014Or04) T=2 T <sub>z</sub> =-1. Estimated %γ=56 6 from this level (2014Or04), but only 45% is accounted for by 861.2 and 1834.5 γ rays; remaining 11% (~5 units of absolute photon intensity) must be associated with unobserved gamma-rays from 3510 level. E(p)=2948 10, I(p)=18.8% 10. E(level): Isobaric Analogue State (IAS). This level corresponds to 3527, 0 <sup>+</sup> in $^{56}\text{Co}$ mirror nuclide; level from 2013Fu15 in ( $^3\text{He},t$ ) and also in $^{56}\text{Co}$ Adopted Levels in ENSDF database).

<sup>†</sup> 2014Or04 and 2016Or03 deduced level energies using  $S_p(^{56}\text{Cu})=560$  140 (syst,2003Au03)+E<sub>p</sub>(c.m.). Excitation energies deduced using  $S_p(^{56}\text{Cu})=190$  200 (syst,2012Wa38) and listed in column 5 of Table II in 2014Or04 are listed under comments. Using  $S(p)(^{56}\text{Cu})=583$  6 in 2021Wa16, and E(p) from 2016Or03 (and 2014Or04) evaluator has deduced the level energies. E(p) values listed in Table I of 2014Or04 and Table V of 2016Or03 are in the c.m system. Levels listed here in  $^{56}\text{Cu}$  are identified as mirror partners of corresponding levels in  $^{56}\text{Co}$  based on S(p)=583 6 from 2021Wa16.

<sup>‡</sup> Assignments are based on those in 2014Or04 and 2016Or03 from log ft values and correspondence with mirror states in  $^{56}\text{Co}$ .

 **$\varepsilon, \beta^+$  radiations**

B(GT) and B(F) are transition strengths for allowed Gamow-Teller and Fermi β transitions, respectively.
