The authors' value is 0.57 <i>I8</i> calculated with $T_{1/2}=6.8$ ps. $T_{1/2}$: weighted average of 6 ps 2 (1961Ke06), 7.4 ps <i>I1</i> (1961Me11), 6.7 ps <i>I3</i> (1963Be29), and 5.6 ps 28 (1964Bo22). $T_{1/2}$: from $\Gamma=0.118$ eV <i>I0</i> (1998Is05). $\Gamma_{\gamma^0}^2/\Gamma=0.077$ eV <i>I2</i> (1984Ch14). $g\Gamma_{\gamma^0}^2/\Gamma=0.251$ eV (1994IsZZ).

The authors point out that their Γ is probably an upper limit since a comparison of yields at 10.3 and 7.6 MeV indicate very strong feeding of this level from above, an observation that could account for the difference in $T_{1/2}$ values.
