

$^{51}\text{V}(^{10}\text{B},\text{p}2\text{n}\gamma)$  2006Si37

Type	Author	Citation	Literature Cutoff Date
Full Evaluation	C. D. Nesaraja and B. Singh	ENSDF	31-Oct-2015

2006Si37 (also 2005Si28,2005Si37): E=33, 36 MeV. Measured  $E\gamma$ ,  $I\gamma$ , lifetimes,  $\gamma\gamma$ ,  $p\gamma$  coin using the Saci-Perere  $\gamma$ -ray spectrometer consisting of a  $4\pi$ -charged particle array of 11 plastic phoswich scintillator  $\Delta E$ -E telescopes, and four Compton suppressed HPGe detectors (two placed at  $37^\circ$  and two at  $101^\circ$  with respect to the beam axis). Lifetimes measured using Doppler-shift attenuation method (DSAM) and line-shape analysis which included the recoil spread due to particle emission.

<sup>†</sup> From least-squares fit to  $E\gamma$  data. Using the uncertainties given **2006Si37**, normalized  $\chi^2=6.8$  is much larger than the critical value of 2.0. The evaluators have increased the uncertainties of the following  $\gamma$  rays as follows to obtain an acceptable fit: 0.14 keV for 727.63 $\gamma$ , 0.3 keV for 1050.9 $\gamma$ , 0.2 keV for 1550.7 $\gamma$  and 0.6 keV for 1460.5 $\gamma$ .

<sup>‡</sup> As proposed by **2006Si37** based on  $\gamma\gamma(\theta)$ (DCO) measurements and band associations. In Adopted Levels dataset, the assignments are the same, except that parentheses have been added when strong arguments are lacking.

<sup>#</sup> From Doppler-shift attenuation method (**2006Si37**), unless otherwise stated.

@ From Adopted Levels.

& Band(A): g.s. Band.

<sup>a</sup> Band(B):  $\gamma$  cascade based on 6<sup>+</sup>.

<sup>b</sup> Band(C):  $\gamma$  cascade based on 5<sup>+</sup>.

<sup>f</sup> Band(G): Band based on 6<sup>+</sup>.

 $\gamma(^{58}\text{Co})$ 

DCO= $I_\gamma(\gamma_1$  at 37°; gated with  $\gamma_2$  at 101°)/ $I_\gamma(\gamma_1$  at 101°; gated with  $\gamma_2$  at 37°); expected  $R_{\text{DCO}}=1.0$  and 0.49 for  $\Delta J=2$  and  $\Delta J=1$  transitions, respectively, with intermediate values for moderately mixed M1+E2 transitions.  $\Delta J=0$  transitions could give values between 1.1 (pure dipole) and 0.44 (large mixing ratios). The gating transitions are  $\Delta J=2$ , quadrupole type, unless otherwise stated. For reference, DCO=0.458 for 321.37 $\gamma$  and 0.41 for 433.15 $\gamma$  are used.

<sup>†</sup> Ordering of the 802-1600 cascade is from the level scheme figure 1 of 2006Si37. It is listed as reversed in authors' table I. The ordering given in the level scheme figure seems preferred from the relative intensities of the two  $\gamma$  rays.

<sup>‡</sup> From DCO ratios; dipole character is implied from  $\Delta J=1$  transition. Small quadrupole admixture is also possible.
