

$^{58}\text{Fe}(\text{p},\text{p}')$ **1971Li14**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	M. Shamsuzzoha Basunia	NDS 151, 1 (2018)		1-Apr-2018

Others: [1975Br29](#) ($^{58}\text{Fe}(\text{p},\text{p}'\gamma)$), [1972Pe23](#).[1971Li14](#): $E(\text{p})=2.0\text{-}3.1 \text{ MeV}$, but data not analyzed beyond 2.65 MeV; measured $\sigma(E(\text{p}),\theta)$, $\theta=90^\circ, 120^\circ, 135^\circ$, and 160° , beam resolution 300-400 eV.See [1972Pe23](#) for correlations between fine structure widths of 14 $^{59}\text{Fe}(\text{g.s.})$ analogue fragments in (p,p) , (p,p') and (p,γ) , $E(\text{p})\approx 2210\text{-}2300$. ^{59}Co Levels

Data are from [1971Li14](#). The fragmented analogues of $^{59}\text{Fe}(\text{g.s.})$ ($J^\pi=3/2^-$, 14 fragments) and $^{59}\text{Fe}(287)$ ($J^\pi=1/2^-$, 10 fragments) have their centroids at $E(\text{p})(\text{lab})=2220$ 5 and 2512 5, respectively. A third analogue near $E(\text{p})=2.98 \text{ MeV}$ was identified but not analyzed. Since $E(\text{p})$ is well below the Coulomb barrier, only s-, p- and d-wave resonances are expected.

≈10293	(3/2 ⁻)	2980≈		J ^π : analogue of 3/2 ⁻ ^{59}Fe (726 level); identified but not analyzed in detail by 1971Li14 .

[†] Calculated as E(p)(c.m.)+S(p), where S(p)=7363.6 4 (**2017Wa10**).

[‡] From multilevel, multichannel R-matrix analysis of $\sigma(E(p),\theta)$.

[#] Γ_{p0} in eV (**1971Li14**). $\Gamma_{p'}(811)$ was neglected in analysis by **1971Li14** and, typically, $\Gamma_\gamma \ll \Gamma_{p0}$ (see (p, γ)), so $\Gamma_{p0} \approx \Gamma$. See **1972Pe23** for additional Γ_{p0} and Γ_{p1} data.

[@] Laboratory proton energy of resonance (**1971Li14**); $\Delta E \approx 3$ keV (absolute), 0.2 keV (relative). E(p) from **1972Pe23**, **1975Br29** ≈ 5 keV higher.

[&] Possible ^{59}Fe (g.s.) analogue fragment (**1971Li14**). Analogue energy estimated to be 9545 5 (**1971Li14**).

^a Possible ^{59}Fe (287 level) analogue fragment (**1971Li14**). Analogue energy estimated to be 9835 5 (**1971Li14**).
