E=183 and 250 MeV, $\sigma(\theta)$, $\theta=35^\circ-95^\circ$, magnetic spectrograph, FWHM $\approx 0.1\%$, enriched target (1969To08).

E= 205 MeV, and others, spectrum at $\theta(\text{lab})=140^\circ$ and 180° to cover the momentum transfer region 1.5 to 2.7 fm $^{-1}$, enriched target, identified 8 $^-$ states (1981Li19).

For giant resonance region, see 1980Pi02, 1977Kh04, 1976Li23, 1974Gu29, 1974Gu16, 1973Gu22.

For theoretical analysis see 1985Mo07 (for data in 1969To08) and 1988Cl03 (for data in 1981Li19).

[†] From comparison of the form factor with Born approximation (1969To08), except as noted otherwise.

[‡] Based on a least-squares fit assuming an M8 (g9/2,f7/2,-1) transition and with use of harmonic oscillator radial wave functions with oscillator constant B= 1.98 fm (1981Li19), 1981Li19 give B(M8) $\uparrow(8^- \text{ levels})>7500$ but their quoted units are not correct.
