1978Me17: (pol p,d) E=18 MeV polarized proton beam was produced from the McMaster FN tandem. Target was $100 \mu\text{g}/\text{cm}^2$ ^{64}Zn ($>99.9\%$ enriched). Reaction products were momentum-analyzed with an Enge split-pole magnetic spectrograph (FWHM=25 keV) and detected with an resistive wire position-sensitive proportional counter. Measured $\sigma(E_d, \theta)$, vector-analyzing power. Deduced levels, J, π , L-transfers, spectroscopic factors from DWBA analysis.

1968Jo16: (p,d) E=26 MeV proton beam was produced from the University of Colorado cyclotron. Target was enriched ^{64}Zn . Reaction products were detected with a Si(Li) counter telescope (FWHM=100 keV). Measured $\sigma(E_d, \theta)$. Deduced levels, J, π , L-transfers, spectroscopic factors from DWBA analysis. Comparisons with available data.

1966Mc15: (p,d) E=17.5 MeV proton beam was produced from the Princeton cyclotron. Target was about $1 \text{ mg}/\text{cm}^2$ isotopically enriched ^{64}Zn foil. Reaction products were detected with silicon surface barrier detectors. Measured $\sigma(E_d, \theta)$. Deduced levels, J, π , L-transfers, spectroscopic factors from DWBA analysis.

Other:

1976Gu08: E=23.3-42.4 MeV proton beams were produced from the Milan University AVF cyclotron. Target was 98.9% enriched ^{64}Zn . Reaction products were detected with a ΔE -E telescope of surface barrier detectors (FWHM=120 keV). Measured $\sigma(E_d, \theta)$. Deduced levels.
