1975Li14: E=1.0-2.5 MeV proton beams from the 3-MeV Van de Graaff accelerator at the Tsing Hua University. Measured E γ , I γ , excitation function with NaI(Tl), γ singles with Ge(Li), $\gamma\gamma$ -coin with NaI(Tl)-Ge(Li) detectors. Deduced levels.

Other: [1973Hs02](#).

The level scheme of ^{71}As is based on measurements of deexcitation γ rays at E(p)=2.434 and 2.030 MeV. [1975Li14](#) state that they observed 149 proton resonances in the energy 976 to 2466 keV, but only 21 were shown in a spectral figure in the energy range 1382 to 2461 keV.

 ^{71}As Levels

E(level) [†]	J $^\pi$ [‡]	Comments
0	5/2 $^-$	
145 2		J $^\pi$: there are two levels at 143.49 7 with J $^\pi$ =(1/2) $^-$ and 147.41 4 with J $^\pi$ =3/2 $^-$ in Adopted Levels.
510 2	(3/2) $^-$	
829 2	(3/2) $^-$	
870 2	(5/2) $^-$	J $^\pi$: (3/2 $^-$,5/2 $^-$) suggested by 1975Li14 .
924 2	(7/2) $^-$	
991 2	(3/2,5/2) $^-$	J $^\pi$: (1/2,3/2) suggested by 1975Li14 .
1007 3	1/2 $^-,3/2^-$	J $^\pi$: (1/2,3/2) suggested by 1975Li14 .
1243 4	(3/2 $^-,5/2^-$)	J $^\pi$: (3/2 $^-,5/2^-$) suggested by 1975Li14 .
1410 4	1/2 $^-,3/2^-$	
1467 4		
1490 5		J $^\pi$: (1/2,3/2) suggested by 1975Li14 .
1533 5	1/2 $^+$	
1609 5	1/2 $^-,3/2^-$	J $^\pi$: (1/2,3/2) suggested by 1975Li14 .
1974 5	7/2 $^+,9/2^+$	
2360 5

[†] Primary γ rays for $E(\text{p})=2.03$ MeV have been observed by 1975Li14, but the energies have not been given. These were derived from the measured Q value of 4619 5, the incident proton energy and the level energies populated by the γ rays.

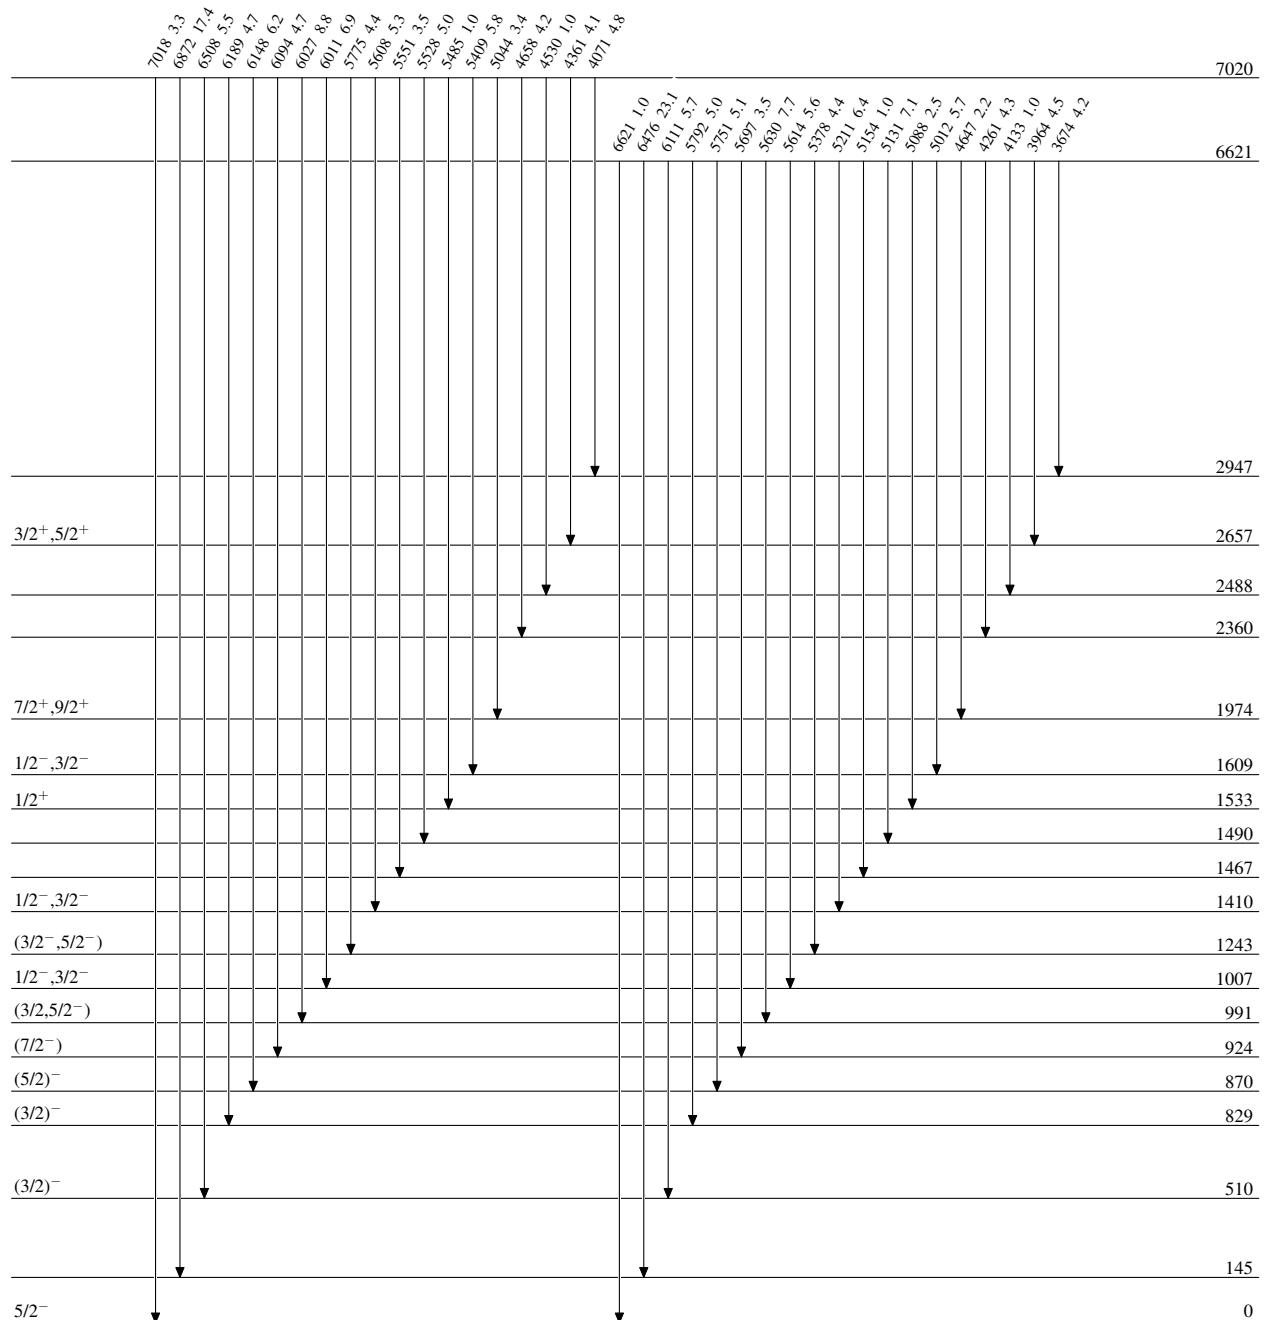

[‡] Uncertainties of the primary and secondary γ rays have not been given by 1975Li14 and have been estimated from Q value and level energies.

[#] 510 γ is mixed with a strong 511-annihilation radiation line in spectra Fig. 4 of 1975Li14. Most likely, 510 level corresponds to the 506.18 level in the Adopted Levels, where the γ -ray data have been taken from ^{71}Se ε decay. No 510 γ was reported in ^{71}Se decay. Rather the main γ ray from the 506 level is 358.8 keV, which could correspond to the strong 360-keV γ in spectral Fig. 4. 1975Li14 placed 360 γ from 870-keV level, whereas 358.8 γ was placed only from the 506 level in ^{71}Se decay. The 510 γ is not included in the Adopted Levels, Gammas, and the 360 γ is placed from only the 506 level in the Adopted dataset.

[@] Relative photon branching for γ rays from the 6621 and 7020 resonances are given.
