1975ShYV: E(p)=35 MeV from the MSU cyclotron. Measured $\sigma(\theta)$ from 6° to 60° using an Enge split-pole magnetic spectrograph, FWHM \approx 8 keV. Deduced levels, L-transfers, Spectroscopic factors from DWBA analysis.

1973Fo01: E(p)=20 MeV from the Chalk River MP tandem. Measured $\sigma(\theta)$, $\theta=15^\circ$ to 65° with E- Δ E detectors, FWHM=30-40 keV. Deduced levels, L-transfers, spectroscopic factors from DWBA analysis.

[†] From 1975ShYV. Uncertainty in level energies is stated in 1975ShYV as 1.5 keV/1 MeV. Values from 1973Fo01 are given under comments.

[‡] Doublet.

From comparison of $\sigma(\theta)$ distributions with DWBA predictions. 1975ShYV consider the following orbitals as the most probable for pickup of neutron at low excitation energies: $p_{1/2}$ or $p_{3/2}$ orbitals for L=1, $2d_{5/2}$ for L=2, $f_{5/2}$ for L=3 and $g_{7/2}$ for L=4.

@ For L-1/2.

& For L+1/2.

^a Same L transfer reported in 1973Fo01.
