

<sup>52</sup>Cr(<sup>28</sup>Si,2pn $\gamma$ ) 1987Gr27

Type	History		
	Author	Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh	ENSDF	30-Sep-2020

1987Gr27: E=98 MeV. Measured  $\gamma$ ,  $\gamma\gamma$ ,  $\gamma(\theta)$ . Natural chromium target (84% <sup>52</sup>Cr). <sup>55</sup>Mn(<sup>28</sup>Si, $\alpha$ pn $\gamma$ ) E=108 MeV was also used in this study but the data reported are from <sup>52</sup>Cr(<sup>28</sup>Si,2pn $\gamma$ ) E=98 MeV.

<sup>†</sup> From least-squares fit to E $\gamma$  data.

<sup>‡</sup> From 1987Gr27 based on  $\gamma(\theta)$  data, multipolarity assignments, and band associations. The assignments are essentially the same in Adopted Levels, except for the difference in parentheses for some of the cases.

# Level is not supported in a more recent and high-statistics high-spin study (1997Sy01) where levels up to 55/2 are populated. For this reason the evaluator has omitted this level in the Adopted dataset. Moreover, 1990Jo07, from the same group as 1987Gr27, also did not report this level.

@ From the Adopted Levels.

& Band(A):  $\pi=+, \alpha=+1/2$ . Q(transition)=1.1 to 2.9 implies  $\beta_2=0.20$  to 0.36 for the two signature partners.

<sup>a</sup> Band(a):  $\pi=+, \alpha=-1/2$ .
