$E(p)=4.0$ MeV, 99.6% ^{81}Br target, Ge(Li) detector; measured $E\gamma$, $I\gamma$.

In the course of a study of the $^{81}\text{Br}(p,n\gamma)$ reaction, authors assign a number of observed γ rays to the $^{81}\text{Br}(p,p'\gamma)$ reaction but do not place them in a level scheme. The evaluator has tentatively placed all but one of these in a manner consistent with Adopted Levels, Gammas.
