

$^{81}\text{Se} \beta^-$  decay (18.45 min) 1969Zo06,1971Do09

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Coral M. Baglin	NDS 109, 2257 (2008)	15-Aug-2008

Parent:  $^{81}\text{Se}$ :  $E=0$ ;  $J^\pi=1/2^-$ ;  $T_{1/2}=18.45$  min  $I_2$ ;  $Q(\beta^-)=1585.3$  22;  $\% \beta^-$  decay=100.0

Others: 1960Ku06, 1963Ar01, 1967Pr06, 1967Yt03, 1969Be82, 1971Na18, 1974Ve12, 1974SaYH.

1969Zo06: chemically separated Se from  $^{80}\text{Se}(n,\gamma)$  (99.87%  $^{80}\text{Se}$ ); measured  $E_\gamma$ ,  $I_\gamma$  with Ge(Li), FWHM=2.5 keV at  $E_\gamma=1332$ , and  $\gamma\gamma$  coin with Ge(Li) and NaI, FWHM=7.0 keV at  $E_\gamma=1332$ .

1971Do09: source from  $^{82}\text{Se}(\gamma,n)$  (89.1%  $^{82}\text{Se}$  target); measured  $E_\gamma$ ,  $I_\gamma$ ,  $\gamma\gamma$  coin,  $\gamma(t)$ ; Ge(Li) (FWHM=3.6 keV at 1 MeV) and, for  $E_\gamma < 300$ , x-ray Ge(Li) spectrometer (FWHM=0.8 keV at 50 keV, 1.3 keV at 300 keV).

1974Ve12: source from  $^{80}\text{Se}(n,\gamma)$   $E$ =thermal (96.87%  $^{80}\text{Se}$  target); measured  $E_\gamma$ ,  $I_\gamma$ ; Ge(Li) FWHM=4 keV at 662 keV.  $\Delta E(\gamma)$  not given; no isomeric assignment made for observed  $\gamma$  rays.

 $^{81}\text{Br}$  Levels

The adopted decay scheme is based on those from 1969Zo06 and 1971Do09, with minor revisions by the evaluator. The tentative 815 level (deexcited by an 815 $\gamma$ ) and the 1352 level (deexcited by 1352 $\gamma$  and 787 $\gamma$ ), proposed by 1974Ve12 without the benefit of coin information, are not adopted by the evaluator. The 787 $\gamma$  presumably corresponds to the weak lines reported at 789.2 5 and 787 2 by 1971Do09 and 1969Zo06, respectively, and that  $E_\gamma$  implies  $E(\text{level})=1354.5$  5 which does not fit the 1352 $\gamma$  well. An  $E_\gamma=789.6$  7 line in (p, $\gamma$ ) is placed as the major branch from a 1327 level, and the evaluator tentatively introduces this level into the decay scheme to accommodate the 789.2 $\gamma$  of 1971Do09. The evaluator also tentatively introduces the known 1105 level ( $J^\pi=1/2^-$ , 3/2 $^-$ ) to accommodate the weak unplaced 1105  $I$   $\gamma$  from 1971Do09.

$\beta^-$  radiations (continued)

‡ Absolute intensity per 100 decays.

# Existence of this branch is questionable.

$\gamma(^{81}\text{Br})$

I $\gamma$  normalization: 0.0068 5 from I(103 $\gamma$ ,  $^{81}\text{Se}$  IT)/I(276 $\gamma$ ,  $^{81}\text{Br}$ )=12.9 9 for  $^{81}\text{Se}$  source in transient equilibrium (weighted average of 12.2 12 (1969Zo06) and 13.6 14 (1971Do09)), assuming  $\alpha(103\gamma)$ =6.79 and adopted T $_{1/2}$  for  $^{81}\text{Se}$  isomers.

Authors, typically, have employed  $^{81}\text{Se}$  sources in which the 57-min and 18-min isomers are in transient equilibrium, and quote I $\gamma$  relative to I $\gamma$ =100 for the 103 $\gamma$  in  $^{81}\text{Se}$  (57 min) IT decay. Following 1969Zo06 and 1971Do09, the evaluator has deduced I(276 $\gamma$ ) appropriate to  $^{81}\text{Se}$  (18 min) decay alone using the measured I(276 $\gamma$ ) for  $^{81}\text{Se}$  (57 min+18 min) decay and I(260 $\gamma$ ) (present in  $^{81}\text{Se}$  (57 min) decay only), assuming  $\alpha(260\gamma)$ =0.0456 and  $\alpha(276\gamma)$ =0.008; I $\gamma$  data from 1969Zo06, 1971Do09 and 1974Ve12 were then renormalized so I(276 $\gamma$ , 18-m Se)=100. These data are then in excellent agreement among themselves and with I $\gamma$  obtained by 1969Zo06 by resolving the decay curve for each  $\gamma$  into its two components.

$\alpha(\text{K})_{\text{exp}}$ ,  $\alpha(\text{L})_{\text{exp}}$  data are from 1971Na18, measured with Ge(Li)  $\gamma$  detector and Si(Li) electron spectrometer, calibrated using transitions with well-known  $\alpha(\text{K})$  and  $\alpha(\text{L})$ .

$\gamma\gamma(\theta)$  data: for 290 $\gamma$ -276 $\gamma(\theta)$ , A $_2$ =+0.050 35 (1963Ar01), +0.052 20 (1969Be82) and A $_4$ =+0.031 5 (1963Ar01), +0.08 7 (1969Be82). Weighted averages of data are A $_2$ =+0.052 17, A $_4$ =+0.031 5; these allow  $\delta(290\gamma)$  and  $\delta(276\gamma)$  to be -8 +4-17 and +0.262 20, or -0.262 20 and +8 +17-4, or +0.258 23 and -7.5 +6-7, or +7.5 +7-6 and -0.258 23, none of which is consistent with adopted values of +1.08 18 and -0.10 3, respectively.

1105 <sup>c</sup> 1		1105?	(1/2) <sup>-</sup>	0	3/2 <sup>-</sup>	D			E <sub>γ</sub> : weak γ, isomeric assignment not established (1971Do09); placed by evaluator.
<sup>x</sup> 1352 <sup>&amp;</sup>	0.21 7								

<sup>†</sup> Weighted average of data from 1969Zo06 and 1971Do09, except as noted. I<sub>γ</sub> is photon intensity relative to I(276γ, 18-m <sup>81</sup>Se)=100. Weak γ rays with E<sub>γ</sub>=375 (I<sub>γ</sub>=0.54 6) and E<sub>γ</sub>=815 (I<sub>γ</sub>=0.11 6) on the intensity scale used here are reported by 1974Ve12 (isotopic assignment unknown) and tentatively placed from 650 and 815 levels, respectively, but these gammas are absent in both 1969Zo06 and 1971Do09, so are omitted here.

<sup>‡</sup> From Adopted Gammas, except as noted.

<sup>#</sup> Doublet. I<sub>γ</sub> divided based on γγ coin. Energy separation of components is <0.7 keV (1971Do09) so averaged energy of doublet (290.04 7) is assigned to the

γ(<sup>81</sup>Br) (continued)

stronger component and E<sub>γ</sub>=290.0 7 (suggested by 1971Do09) to the weaker one.

Ⓔ Tentatively placed by evaluator by analogy with (p,γ); placed by 1974Ve12 from a tentative 1352 level which the evaluator does not adopt, but not placed by 1969Zo06, 1971Do09. Isomeric assignment not established.

& Reported by 1974Ve12 only and placed from a 1352 level which the evaluator does not adopt. This γ must be different from the 1350γ deexciting the 1350-keV level in (n,n'γ), because the stronger 327γ and 583γ which also deexcite that level in (n,n'γ) are not seen by 1974Ve12. This γ may not belong to <sup>81</sup>Se β<sup>-</sup> decay.

<sup>a</sup> For absolute intensity per 100 decays, multiply by 0.0068 5.

<sup>b</sup> Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ-ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

<sup>c</sup> Placement of transition in the level scheme is uncertain.

<sup>x</sup> γ ray not placed in level scheme.
