1994Ga15: E=130 MeV. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$ using an array of 18 Ge detectors.

1995Ch29: comment from authors of 1994Ch28 about discrepancies in the assignment of 707γ to ^{84}Sr and enhanced intensity of 432γ . These two γ rays are also in ^{84}Y .

[†] From $E\gamma$'s, assuming $\Delta(E\gamma)=1$ keV for each γ ray.

[‡] As proposed by 1994Ga15 based on earlier assignments in literature and band extensions in their study.

[#] Level not included In Adopted Levels due to its uncertain existence In ^{84}Sr ; the γ ray can Be assigned either to another nuclide or with another level In ^{84}Sr .

[@] Band(A): g.s. band.

^a Band(B): Band based on 8⁺.

[#] Band(C): Band based on 5⁻.

432	17	7207?		6775?		I_γ : according to comment in 1995Ch29 the intensity of this γ ray is much larger than expected and is explained by them as due to contribution from a similar energy transition in ^{84}Y which is expected to be populated in the reaction studied in 1994Ga15.
