2018De35 (also 2019De32): $E(^{238}\text{U})=6.2$ MeV/nucleon from GANIL facility. Target= ^9Be , 2.07 mg/cm^2 thick. Fission products were identified and detected by mass, charge and atomic number using VAMOS++ spectrometer. The γ rays were detected by AGATA array of eight cluster modules of Ge detectors. Measured $E\gamma$, $I\gamma$, (particle) γ -coin, level lifetimes by recoil-distance Doppler-shift (RDDS) method. Comparison with mean-field calculations.
