 $J^\pi(\text{target})=1/2^-$.

1972Ha24: E(d)=30 MeV, 35.5 MeV, and 40 MeV. Measured $\sigma(\theta)$ using ΔE -E telescope consisting of Si surface-barrier detectors and Si(Li) detectors (FWHM=20-30 keV); DWBA analysis.

1967Ka15: E(d)=21 MeV. Measured $\sigma(\theta)$ using ΔE -E telescope consisting of two Si surface-barrier detectors (FWHM=130 keV); DWBA analysis.

[†] From DWBA analysis ([1972Ha24](#)).

[‡] Spectroscopic factor from DWBA measured at 40 MeV ([1972Ha24](#)). Values from [1967Ka15](#) are included in the comments. See [1972Ha24](#) for S values at 30 and 35.5 MeV.

Probably unresolved doublet since S value exceeds theoretical prediction.

@ Sum of L=1 and L=3 strengths.
