Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh	NDS 114, 1 (2013)	20-Oct-2012

Parent: ⁸⁹Mo: E=0.0; J^π=(9/2⁺); T_{1/2}=2.11 min 10; Q(ε)=5635 27; %ε+%β⁺ decay=100.0

⁸⁹Mo-Q(ε): From 2011AuZZ. Other: 5650 30 (2003Au03).

1985Be12: ⁸⁹Mo produced by ^{92, 94, 96}Moxn). Measured γ, γγ.

1981Ga05: ⁸⁹Mo produced by ⁹²Mo(p,p3n). Measured G.

1983OxZZ: measured Eγ, Iγ, γγ.

Energy balance: total decay energy of 5706 keV 36 deduced (using RADLIST code) from proposed decay scheme is in agreement with the expected value of 5635 keV 27, suggesting that the decay scheme is reasonably complete. However, large Q value suggests that the decay scheme may not be well known.

ε,β⁺ radiations

ε+β⁺ branches and associated log ft values are considered as approximate since the decay scheme does not seem well established.

† Absolute intensity per 100 decays.

‡ Existence of this branch is questionable.

γ(⁸⁹Nb)

I_γ normalization: from I_γ(γ[±])=95 3 (1985Be12). It is considered as approximate normalization since the level scheme does not seem well established and contribution of impurities in γ[±] intensity is not known from 1985Be12.
