

$^{89}\text{Y}({}^3\text{He},\text{t})$  **1975Gr11**

Type	Author	History Citation	Literature Cutoff Date
Full Evaluation	Balraj Singh	NDS 114, 1 (2013)	20-Oct-2012

$J^\pi(^{89}\text{Y g.s. target})=1/2^-$ .

**1975Gr11:** E=25 MeV. Measured  $\sigma(\theta)$ , DWBA analysis, FWHM=38 keV.

Others:

**1971Hi11:** E=33 MeV. Measured  $\sigma(\theta)$ , FWHM=30 keV, DWBA analysis of seven groups at 0, 590, 1450, 1510, 1740, 1870 and 8000.

**1983El05** (also **1983Ga15**): E=0.6, 1.2, 2 GeV. Measured  $\sigma(\theta)$ , deduced isobar resonance effects and spin-isospin excitations. At 2 GeV, a strong excitation of  $\Delta$  resonance is observed while low-excitation-energy regions are dominated by spin-isospin excitations.

 $^{89}\text{Zr}$  Levels

E(level)	$J^\pi$ <sup>†</sup>	L	Comments
0	$9/2^+$	3	
592 4	$1/2^-$	2	<b>1975Gr11</b> conclude that this state is not a pure antianalog state (as concluded from L=1 by <b>1971Hi11</b> ), since with L=2, this population of this state in ( ${}^3\text{He},\text{t}$ ) involves spin-flip (S=1) through configuration= $(\pi g_{9/2} \otimes \nu g_{9/2}^{-1})_{1+} \otimes \pi p_{1/2}$ . Dominant configuration= $(\pi g_{9/2}^2)_{0+} \otimes \nu p_{1/2}^{-1}$ .
