[†] From least-squares fit to $E\gamma$, allowing 1 keV uncertainty in $E\gamma$ data for which the authors did not state the uncertainty.

[‡] Tentative values from ($^{40}\text{Ca}, 3p2n\gamma$), based on level systematics in neighboring N=48 odd-A nuclei ([1995Ro06](#)), except as noted. Supported by shell-model calculations in ($p_{1/2}, g_{9/2}$) configuration space for both protons and neutrons; the calculations describe the $\pi=+$ yrast states well.

Possible $\pi=+$, seniority=7 yrast state, by analogy with shell-model calculations for ^{91}Tc .

@ Shell-model calculations by [2000Sc31](#) predict $7/2^+$, $5/2^+$ and $13/2^+$ levels at E=263, 601 and 877, respectively. However, the evaluator presumes that the predicted $13/2^+$ state is the 853 level, not the 864 level (suggested by [2000Sc31](#)).

& Proposed by [2004Mu30](#) in ^{94}Ag εp decay.

^a Band(A): Possible $\pi=+$, seniority=3 states ([1995Ro06](#)). By analogy with shell-model calculations for ^{91}Tc .

^b Band(B): Possible $\pi=+$, seniority=5 states. By analogy with shell-model calculations for ^{91}Tc ([1995Ro06](#)).

^c Band(C): $\pi=(-)$ sequence ([2004Mu30](#)). π based on absence of transitions from higher members to $\pi=(+)$ sequence of levels. Built on ($27/2^-$, $29/2^-$) 4611 level.

^d Band(D): Possible $\pi=+$, seniority=7 states. By analogy with shell-model calculations for ^{91}Tc ([1995Ro06](#)).
