Target isospin $=4$.
1971Ri12: $\mathrm{E}=12 \mathrm{MeV}$; FWHM=1.9 ns tof neutron detection (FWHM $\approx 100 \mathrm{keV}$ for $\mathrm{g} . \mathrm{s}$. and $\approx 60 \mathrm{keV}$ for $\mathrm{E}(\mathrm{level}) \approx 5 \mathrm{MeV}), \geq 99 \%$
${ }^{92}$ Mo target, $\theta(\mathrm{lab})=15^{\circ}-70^{\circ}$ (in $5^{\circ}$ steps), NE213 liquid scintillators, pulse-shape discrimination; measured $\sigma(\theta)$; DWBA analysis (normalization factor $=1.48$ ).
1971Bo33: $\mathrm{E}=6.25 \mathrm{MeV}$ and $7.0 \mathrm{MeV} ; \mathrm{FWHM}=1.2 \mathrm{~ns}$ tof neutron detection (FWHM $\approx 100 \mathrm{keV}$ for g.s.), $\theta$ (c.m.) $=0^{\circ}$ to at least $30^{\circ}$ (to $90^{\circ}$ for strongest states); measured $\sigma(\theta)$; DWBA analysis (normalization factor $=1.48$ ).
1970Za09: $\mathrm{E}=12 \mathrm{MeV}$; neutron tof; $\theta(\mathrm{lab})=15.5^{\circ}, 20^{\circ}, 25^{\circ}$, also $30^{\circ}, 35^{\circ}, 40^{\circ}, 45^{\circ}$ for g.s. analog only; measured $\sigma(\theta)$ for IAS; DWBA analysis. See also 1971Za05 (for further analysis of data from 1970Za09).

${ }^{93} \mathrm{Tc}$ Levels (continued)
${ }^{\dagger}$ From 1971Bo33, if not indicated otherwise.

* Based on DWBA analysis of $\sigma(\theta)$; from 1971Ri12, except as noted.
\# From DWBA analysis (1971Ri12) assuming $\mathrm{g}_{9 / 2}$ and $\mathrm{d}_{5 / 2}$ orbitals for $\mathrm{L}=4$ and 2 transfer, respectively. Data from 1971 Ri12 and 1971Bo33 are in good agreement for strongly populated levels and agree within a factor of $\leq 2$ for weaker states.
${ }^{\circledR}$ From 1971Ri12; absent in 1971Bo33.
\& Observed by 1970Za09; E from Adopted Levels (E not stated by authors).
${ }^{a}$ From DWBA analysis of $\sigma(\theta)$ (1970Za09) assuming the form factor of the transferred proton to be the same as that of the neutron in the parent analog state.
