

$^{92}\text{Zr}(\alpha, 2n\gamma)$ **1971Le19**

Type	Author	History	Citation	Literature Cutoff Date
Full Evaluation	D. Abriola(a), A. A. Sonzogni	NDS 107, 2423 (2006)		1-Jan-2006

1971Le19: E=30 MeV; measured $E\gamma$, $I\gamma$, $\gamma\gamma$ coincidences, $\gamma(\theta)$, $\gamma(t)$. Comparison with other experiments shows that $E\gamma$ and the resulting level energies are systematically smaller by a few keV. This problem persists even after replacing two of the most deviant $E\gamma$ (727.4 10 and 1035.8 10) by their adopted values.

[†] Relative intensity; total of prompt and delayed intensity in-beam at $\theta=126^\circ$.

[‡] Stretched-E2 cascades assumed on the basis of $\gamma(\theta)$, if not noted otherwise. The anisotropies of transitions with delayed components are attenuated.

Uncertain γ .

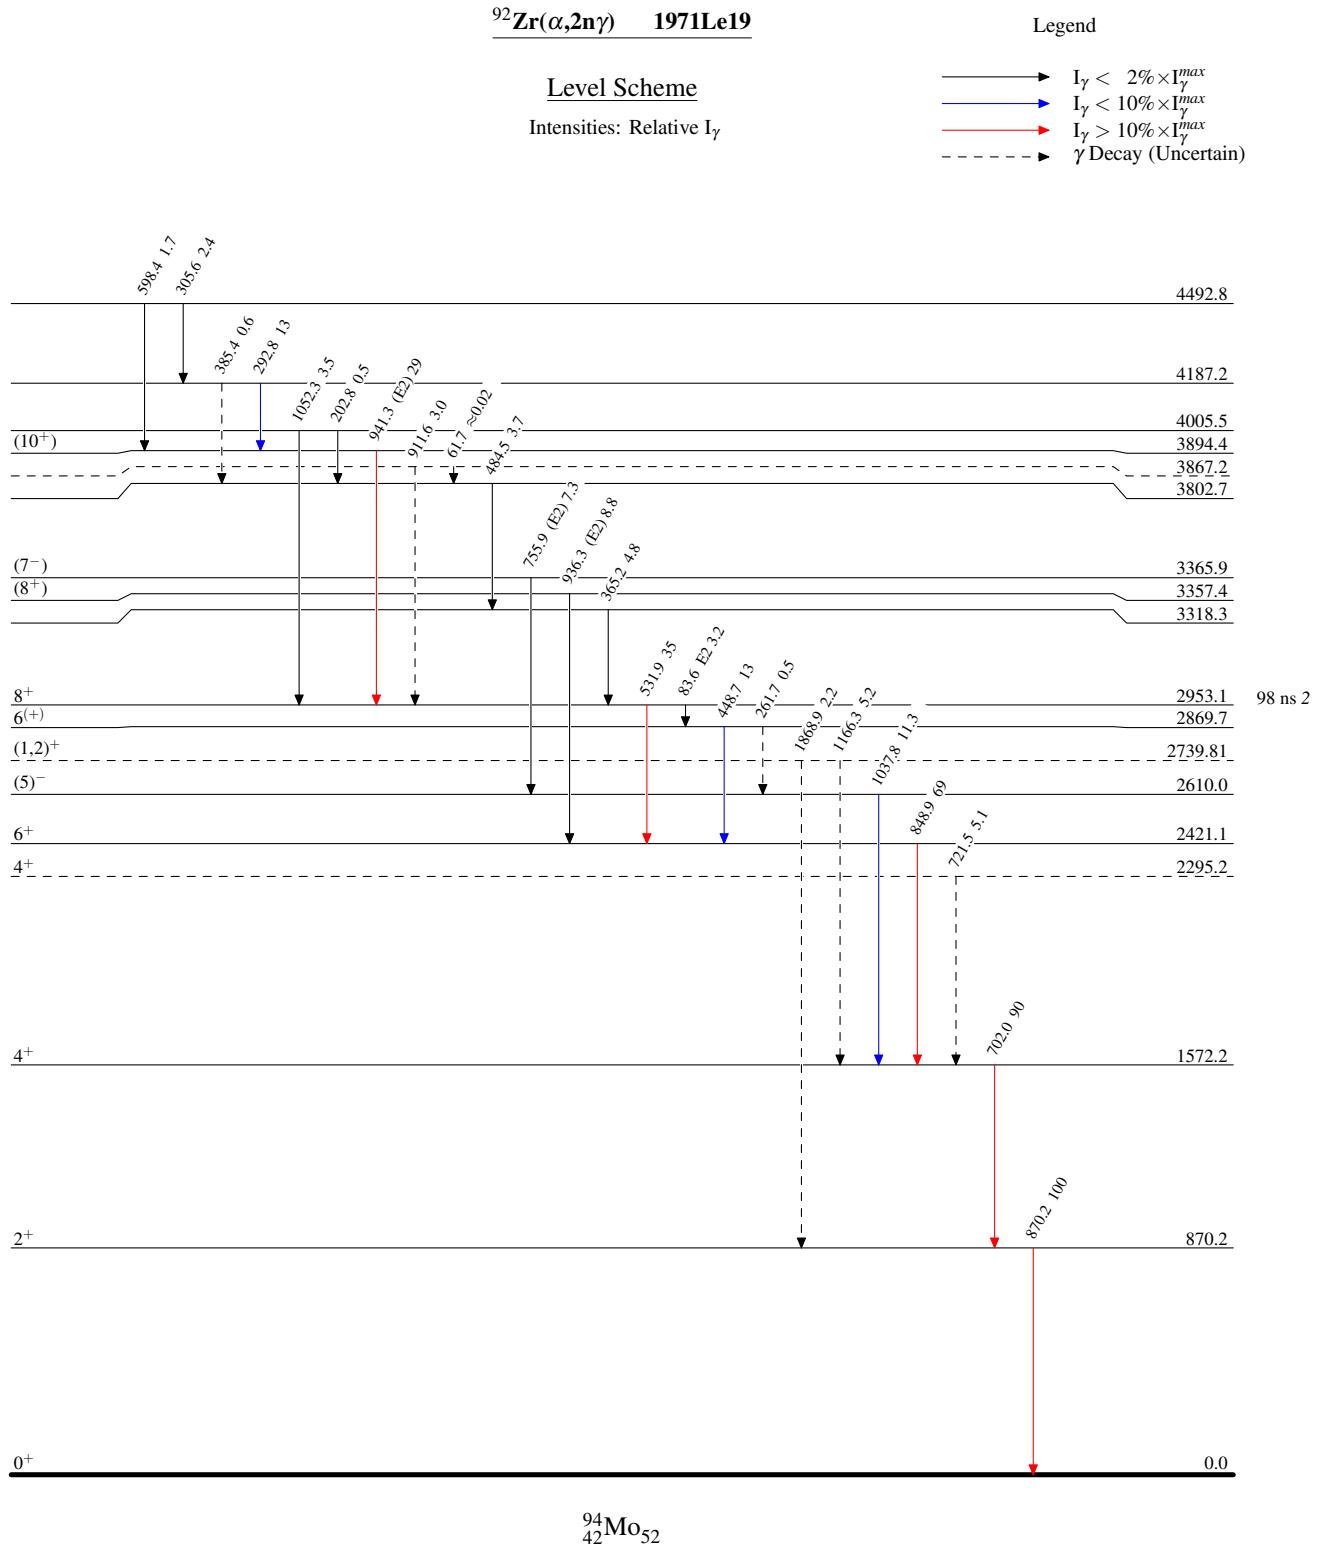

@ Assignment to ^{94}Mo uncertain.

& Not seen in ^{94}Tc β^+ decay (52.0 min). Possibly misplaced.

^a Total theoretical internal conversion coefficients, calculated using the BrIcc code (2008Ki07) with Frozen orbital approximation based on γ -ray energies, assigned multipolarities, and mixing ratios, unless otherwise specified.

^b Placement of transition in the level scheme is uncertain.

^x γ ray not placed in level scheme.
