Parent: ^{96}Ag : E=y; $J^\pi=(8^+)$; $T_{1/2}=4.40$ s 6; Q(ϵp)=6482 SY; % ϵp decay=8.5 15

^{96}Ag - $T_{1/2}$: From 2003Ba39. Other: 4.50 s 6 (1997Sc30).

^{96}Ag -Q(ϵp): 6480 401 (syst,2009AuZZ).

2003Ba39: ^{96}Ag produced by $^{60}\text{Ni}(^{40}\text{Ca},\text{p}3\text{n})$; E=4.35 MeV/nucleon; separated by GSI online separator. Measured E γ , I γ , $\gamma\gamma$, β , $\beta\gamma$, $\beta\gamma\gamma$, delayed protons, x rays, p γ coin using three different systems: 1. plastic scintillator combined with Ge array (15 detectors: two Clovers and one EUROBALL Cluster for $\beta\gamma$ and $\beta\gamma\gamma$ measurement. 2. Large NaI detector for total absorption spectrum (TAS) combined with a Ge detector and two Si detectors for $\beta\gamma$, βp , p γ and x γ events. 3. Two Si detector ΔE -E telescopes for delayed protons (FWHM=80 keV).

1997Sc30: ^{96}Ag produced by $^{60}\text{Ni}(^{40}\text{Ca},\text{p}3\text{n})$ E=4.1 MeV/nucleon. Measured E γ , I γ , $\gamma\gamma$, x γ , Ep, Ip, p γ coin using Ge and Si(Li) detectors. No delayed protons reported from this isomer.

All data are from 2003Ba39.

[†] Uncertainties are from the energies of the delayed protons.

[‡] Placement of transition in the level scheme is uncertain.
