

$^{82}\text{Se}(^{19}\text{F}, \text{p}3\text{n}\gamma)$ **2001Bu01**

Type	Author	History	
Full Evaluation	N. Nica	Citation	Literature Cutoff Date
		NDS 111, 525 (2010)	19-Nov-2009

E=68 MeV, 92% enriched target, energy and efficiency calibration with ^{152}Eu source. Measured $E\gamma$, $I\gamma$, $\gamma\gamma$, neutron- γ , proton- γ coin using Ge detectors for gamma rays and NE213 for neutrons and ΔE -E Si detectors for charged particles at different angles. measured angular distributions In single and $n\gamma$ coin mode, and DCO ratios. IBFM theoretical calculations.

 ^{97}Mo Levels

[†] From a least squares fit to $E\gamma$'s assuming $\Delta E\gamma = \pm 0.1$ keV.

[‡] ADOPTED by 2001Bu01; can differ from adopted values (see Adopted Levels dataset).

Band(A): $vd_{5/2}$ band.

@ Band(B): $v\gamma_{7/2}$ band.

& Band(C): $v\gamma_{11/2}$ band.

 $\gamma(^{97}\text{Mo})$

The population of P3N evaporation channel estimated to Be 5% of the total fusion cross section (28 mb).

The assignment of γ 's to ^{97}Mo had been confirmed by observing all of them In coin with both neutrons and protons, but not with α particles.

DCO ratios were measured from an asymmetric $\gamma\gamma$ coin matrix with one detector At 90° and the other At 45°. They were measured In quadrupole gates, unless otherwise stated. According to 2001Bu02 the DCO ratio for a dipole transition is close to 0.5 when gating on a quadrupole transition and 1.0 when gating on a dipole transition; and the DCO ratio for a quadrupole transition is close to 1.0 when gating on a quadrupole transition and 2.0 when gating on a dipole transition.

Legendre polynomial coefficients are determined from angular distributions measured In coin with neutrons.

1116.7	100 5	1116.67	9/2 ⁺	0.0	5/2 ⁺	(E2)	DCO=1.7 3 (dipole gated). $A_2=+0.50$ 6. $A_4=-0.06$ 8.

[†] From the spectrum At 55° measured In coin with protons, except for 778.4 γ , 846.4 γ , and 947.0 γ (contaminated with transitions In ^{96}Mo) which were estimated from gates on the symmetric $\gamma\gamma$ matrix.

[‡] ADOPTED by evaluator based on angular distribution coefficients or DCO ratios measured by 2001Bu01 considering $\Delta J=2$, Q As $\Delta J=2$, (E2); all the other reported mult's are of the $\Delta J=1$, D type and are adopted As such.
