Parent: <sup>252</sup>Cf: E=0; J<sup>π</sup>=0<sup>+</sup>; T<sub>1/2</sub>=2.645 y 8; %SF decay=?

<sup>252</sup>Cf-From 2005Ni22 (Adopted Levels).

Also <sup>235</sup>U(n,Fγ), E=th: 1980MoZJ, 1970Gr38. 1970Gr38 observed an isomer with T<sub>1/2</sub>=0.47 8 μs and assigned it to either <sup>96</sup>Sr or <sup>97</sup>Sr. No γ rays were observed associated with this T<sub>1/2</sub> (100 keV<Eγ<260 keV).

2003Hw03: measured Eγ, Iγ, γγγ using the Gammasphere array comprised of 102 Compton-suppressed Ge detectors.

1974CIZX: measured Eγ, Iγ, gf(t), Xγ, γγ; isomeric levels have been studied by observing the K x-rays and γ rays from the isomeric decay in coincidence.

2006Hw01: As 2003Hw03 (but using 72 Compton-suppressed Ge detectors) to study isomeric levels; T<sub>1/2</sub>'s determined by γγγ method (supersede 2005Hw01).

Others: 2004Hw02, 1974Su04.

J <sup>π</sup> : adopted by 2003Hw03 from similarity to 9/2[404], 1038.8 isomeric level In <sup>99</sup> Zr (2003Ur01). Previously (11/2 <sup>-</sup> ) was suggested by 1980MoZJ on the basis of systematics with N=57 and N=59 nuclei. T <sub>1/2</sub> : weighted average of 265 ns 27 (2003Hw03) and 255 ns 56 (2006Hw01). Others: 515 ns 15 (1980MoZJ) (in a priv comm in 3/2003 to the editors two of the coauthors of 1980MoZJ (Pfeiffer, Pinston) suggest correcting the T <sub>1/2</sub> to 255 ns 10 to the same scale as T <sub>1/2</sub> (308 level)); 382 ns 11 (1974Su04 – this value is used In 2004Hw02 to compare with 265 ns 27 (2003Hw03); however while 1974Su04 report T <sub>1/2</sub> for a 522.4γ, it does not seem certain that this γ pertains to <sup>97</sup> Sr).
