

USNDP — TUNL Program on Preequilibrium Phenomenology

TUNL Program on PREEQUILIBRIUM PHENOMENOLOGY

Constance Kalbach Walker

PROGRAM

- Exciton preequilibrium model & code
- Suitable for (nucleon,nucleon) rxns at 14 -100 MeV
- Reactions with complex particles require add'l direct reaction models
- PRECO-2000 distributed
- Working toward PRECO-2005
(I hope!)

AREAS OF RECENT STUDY

- Additional work on complex particle channels
 - Neutron induced reactions (cont'd)
 - Role of projectile breakup
- Programmed default for isospin cons'v'n
- Journal article on complex particle channels completed

NEUTRON INDUCED REACTIONS

- Adjust overall NT normalization:

$$(5500/A_A)^n$$

- Excitation of add'l p-h pairs in nucleon transfer:

Verify that norm. depends on $1/V_{eff}$

- Verify trends in V_{eff} from (n,xp) rxns
Larger V_{eff} for heavy targets as E_{inc} increases [surface \rightarrow volume]

USNDP — TUNL Program on Preequilibrium Phenomenology

NUCLEON TRANSFER

- Exponent on $(2Z/A)$ normalization factor
Combine results from full database
 $2(Z_a+1)h_\pi + 2p_v$
Neutron excess hinders
proton pickup
neutron stripping

ROLE OF PROJECTILE BREAKUP

- Fragments emitted at projectile velocity
- Reduces cross section to exciton model
- Change in initial exciton model config?

currently: $\rho_0, h_0 = A_a + 1, 1$

possible: $\rho_0, h_0 = A_a, 0$

FUTURE WORK NEEDED!
(not yet included in PRECO)

USNDP — TUNL Program on Preequilibrium Phenomenology

COMPARISONS – Neutrons at 63 MeV

USNDP — TUNL Program on Preequilibrium Phenomenology

COMPARISONS – Protons at 63 MeV

USNDP — TUNL Program on Preequilibrium Phenomenology

COMPARISONS – Deut. at 70-80 MeV

USNDP — TUNL Program on Preequilibrium Phenomenology

COMPARISONS – Alphas at 140 MeV

FUTURE WORK

- Write article on isospin conservation
- Add auxiliary states in exciton model residual state densities
- Formulate breakup model and include in PRECO; study impact on exciton model
- New release of PRECO

TIME REQUIRED? PRIORITIES?
