

Cross Section Measurements and Analysis at Rensselaer

Report to CSEWG November, 2008

Y. Danon, R. C. Block, N. Francis, M. Lubert, M. Rapp, F. Saglime, R. Bahran, C. Romano, J. Thompson
Rensselaer Polytechnic Institute, Troy, NY, 12180

and

D.P. Barry, N.J. Drindak, J.G Hoole, G. Leinweber, Molly Ernesti

KAPL Inc., Lockheed Martin Corporation, Schenectady, NY 12301-1072

Measurements Completed This Year

- Ti, Zr
 - High energy (0.5-20 MeV) transmission
- Be, Mo
 - High energy (0.5-20 MeV) neutron scattering
- Elemental Eu and ^{153}Eu
 - Epi thermal (2-2000 eV) transmission and capture
 - Thermal (0.01-20 eV) transmission
- ^{238}U
 - Resonance scattering
- ^{239}Pu fission fragment mass and energy distributions with the RPI LSDS
- Elemental Samarium
 - (n, α) cross section measurements with the LANL LSDS

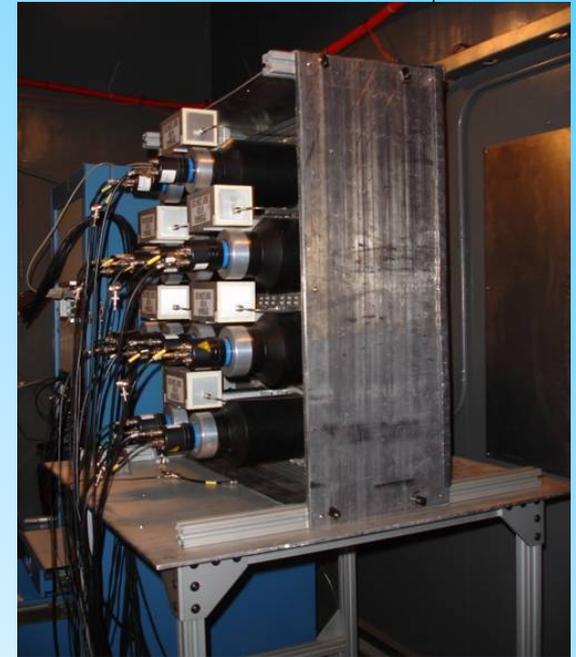

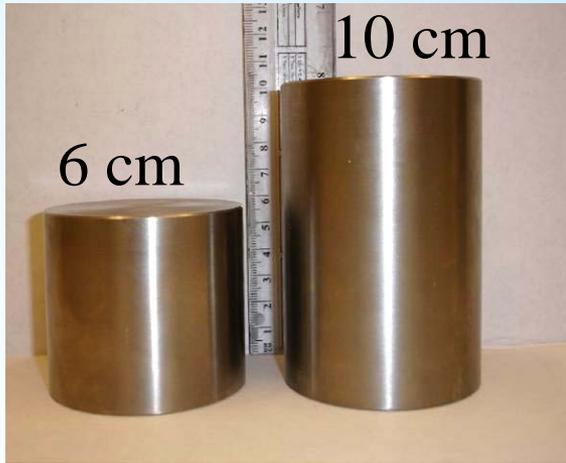

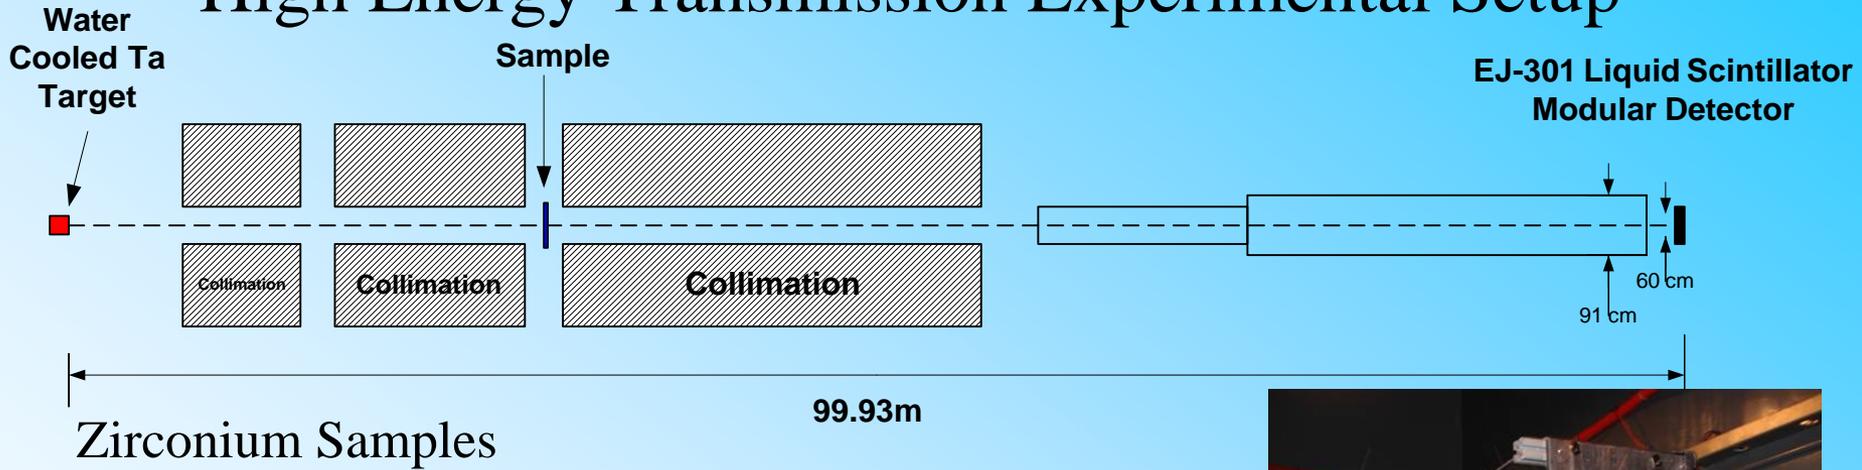

Planned Measurements

- High energy (0.5-20 MeV) neutron scattering from Zr
- Resonance region (1 eV- 400 keV) transmission for Mo
 - ORNL is preparing samples of $^{95,96,98,100}\text{Mo}$.
- Capture measurements of $^{155,156,157,158,160}\text{Gd}$ (NCSP).
- Fission fragment mass and energy distributions of ^{248}Cm
- (n, α) cross section measurements on ^{149}Sm with the LSDS

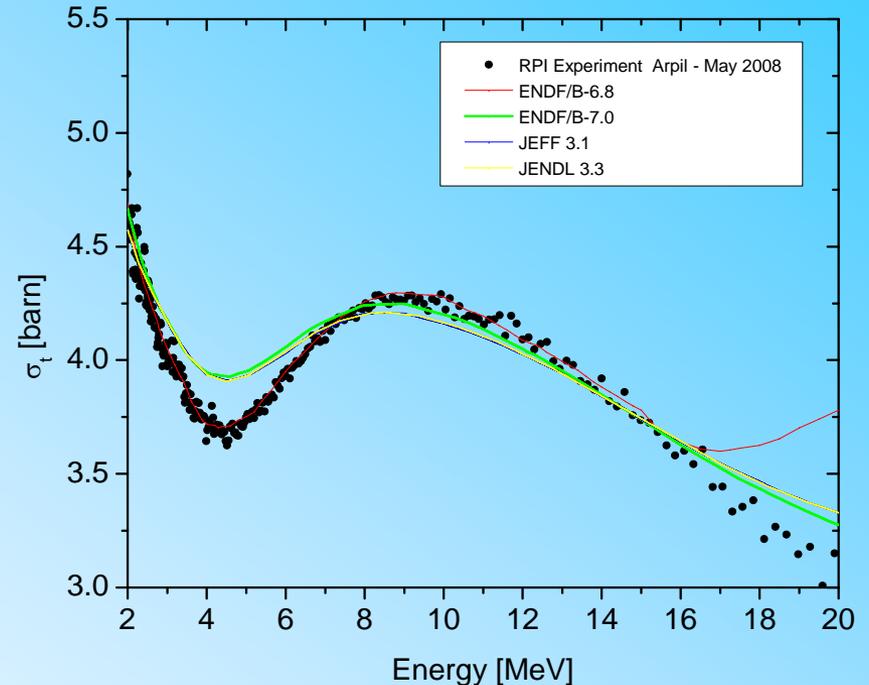

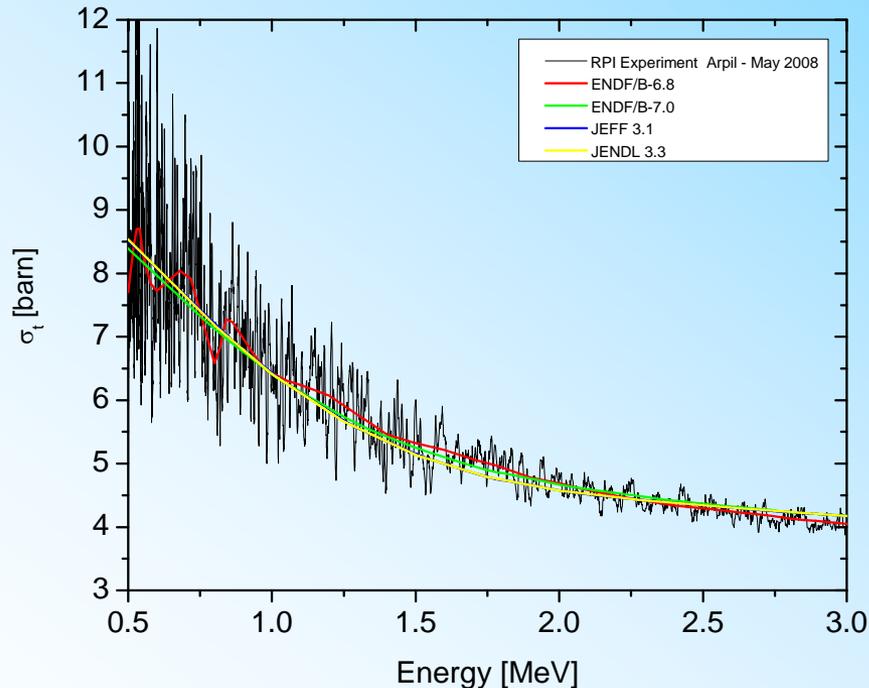

Data Analysis

Sample	Status
Rh	SAMMY analysis pending
Cd	REFIT analysis pending (Moxon has our data)
Re	Data analysis suspended
Eu	Data analysis started
U-236	New samples and a transmission measurement required for completion of this task
^{164}Dy	Data analysis and resonance parameters of the epi-thermal region are in Molly Ernesti's MS Thesis.
Be,Mo,Zr,Ti	High energy (0.5-20MeV) transmission analysis in progress
Be, C, Mo	High energy (0.5-20MeV) scattering data analysis in progress

High Energy Transmission Experimental Setup

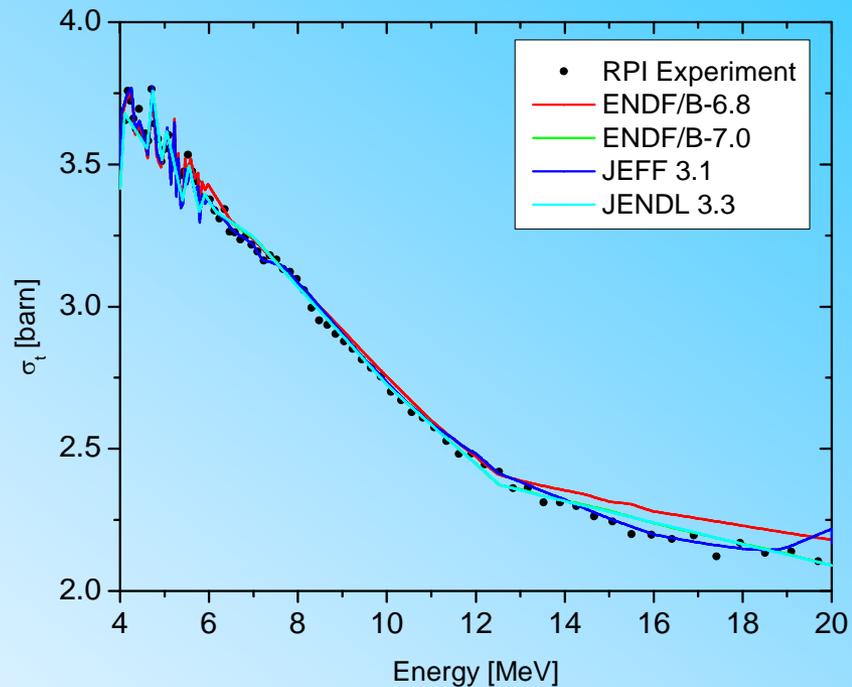

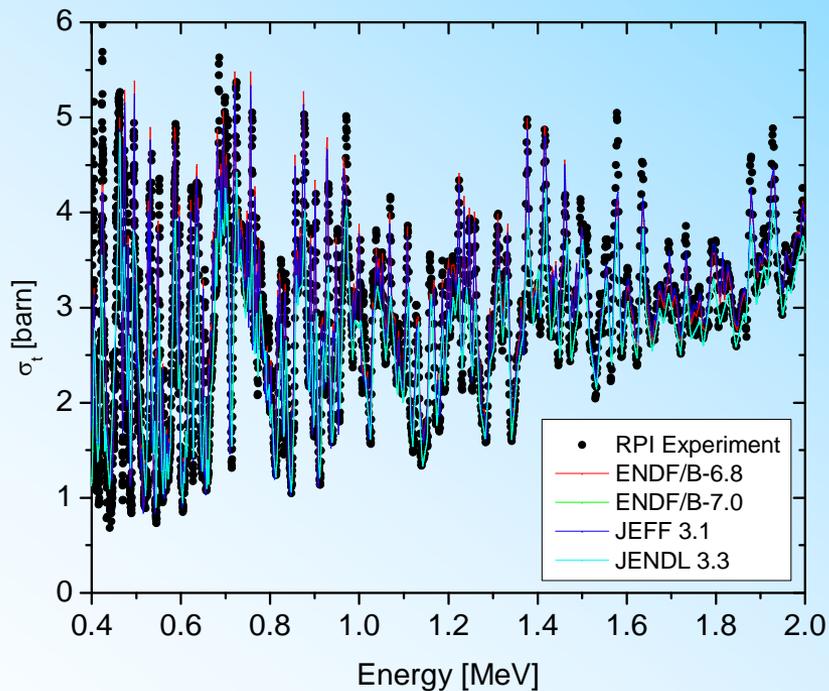

Zr Total Cross Section Measurements (0.5-20 MeV)

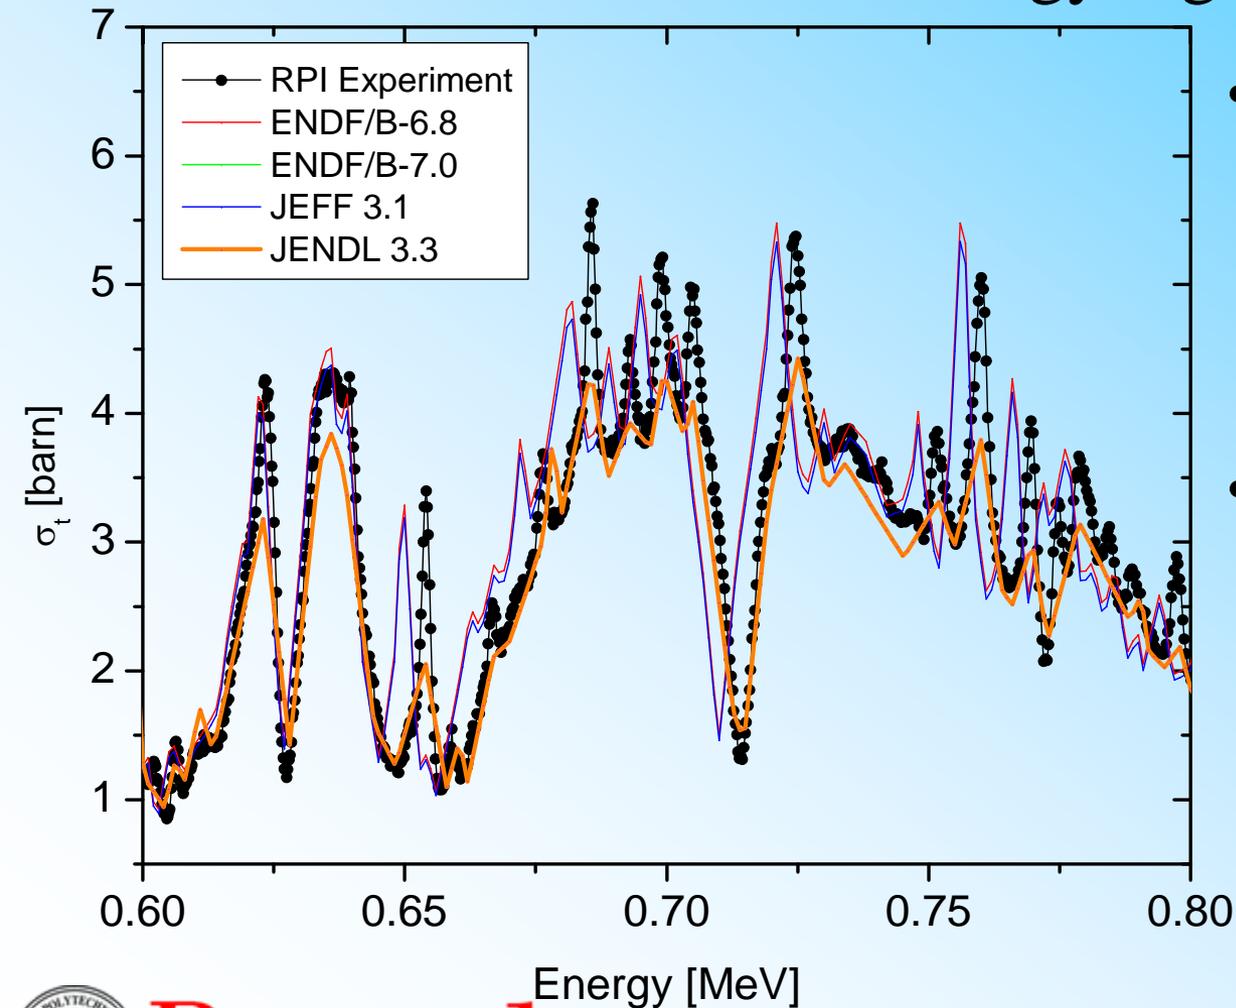

- Used low Hf (less than 100 ppm) Zr metal
- ENDF/B 6.8 seems like a better fit for $E < 16$ MeV
- New partially resolved structure below 2.0 MeV
- Data can be used to improve the unresolved resonance region evaluation

Ti Total Cross Section Measurements (0.5-20 MeV)

- The evaluation are generally in good agreement with the data
- Below 2 MeV the data has better energy resolution than the evaluation

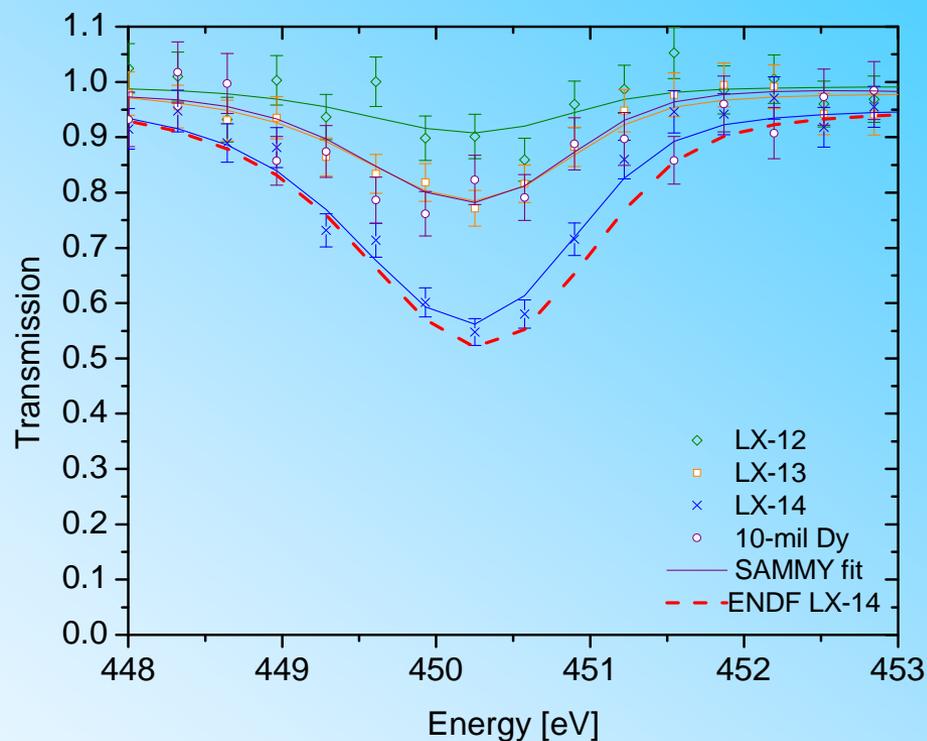

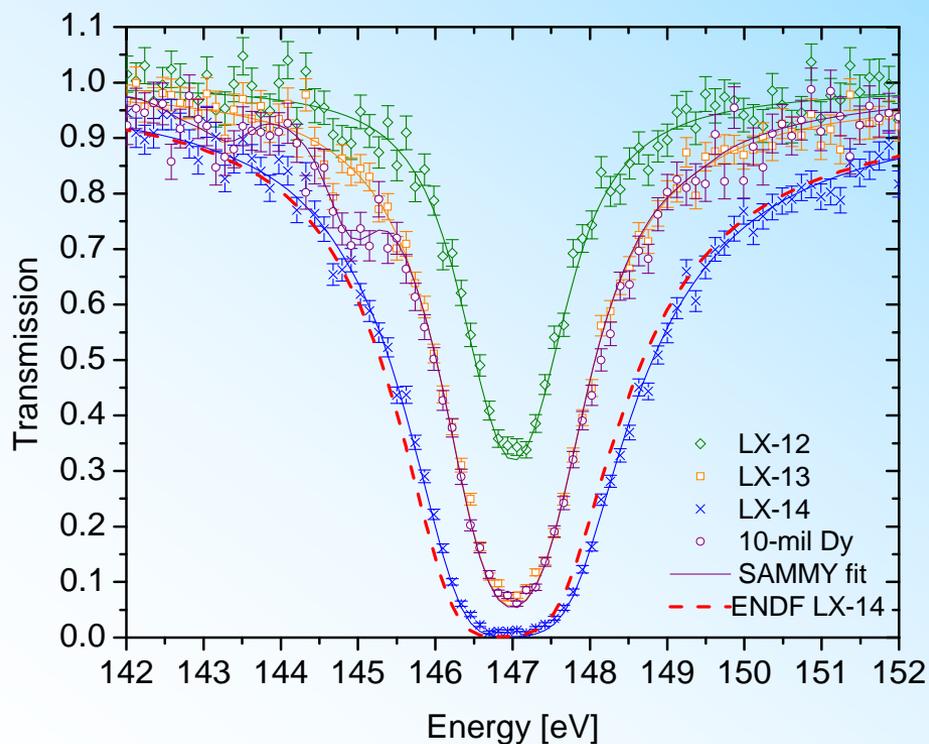

Ti Total Cross Section Measurements 0.5-1 MeV energy region

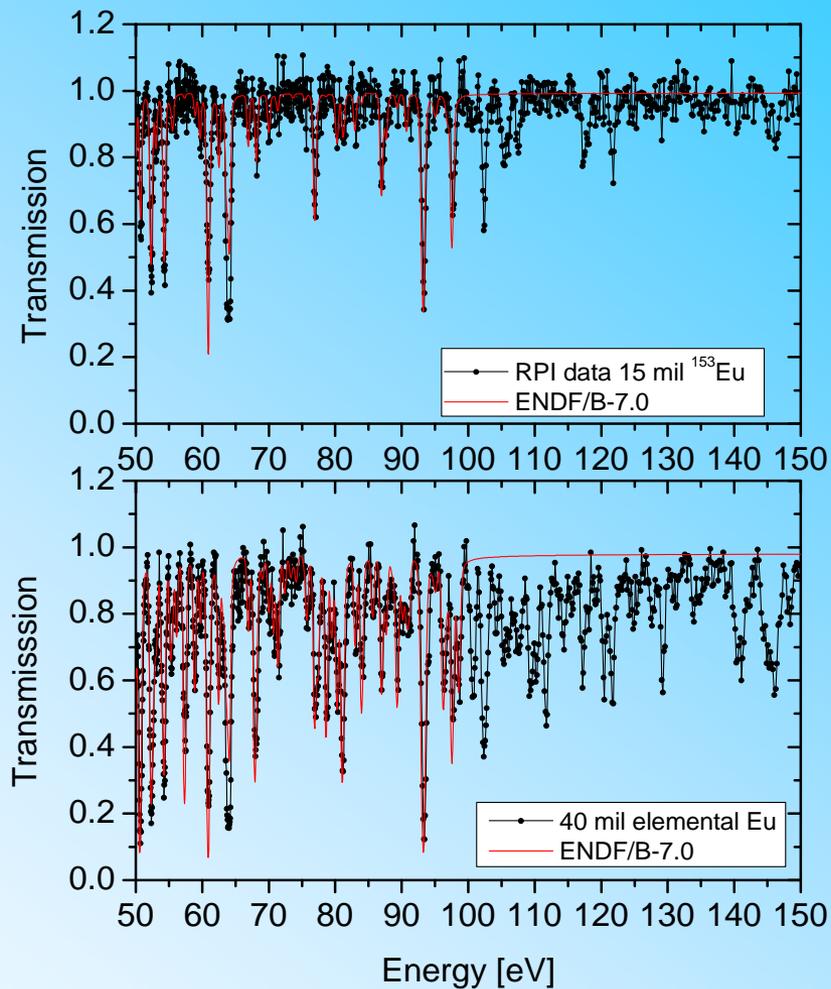

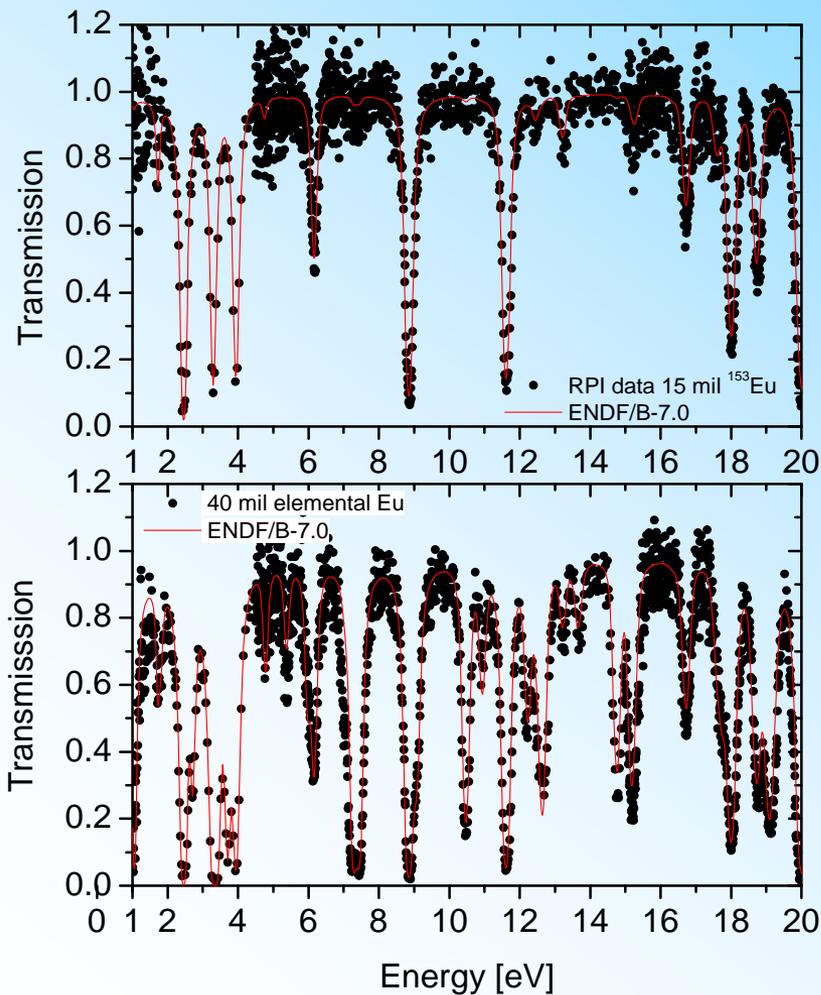

- With the exception of JENDL3.3 and ENDF/B-7.0, all evaluations seem to have an energy shift.
- The JENDL/ENDF evaluation is based on low resolution data.

^{164}Dy Transmission Resonance Analysis

- Samples 98.6% enriched in ^{164}Dy

Eu Transmission compared to ENDF/B-7.0

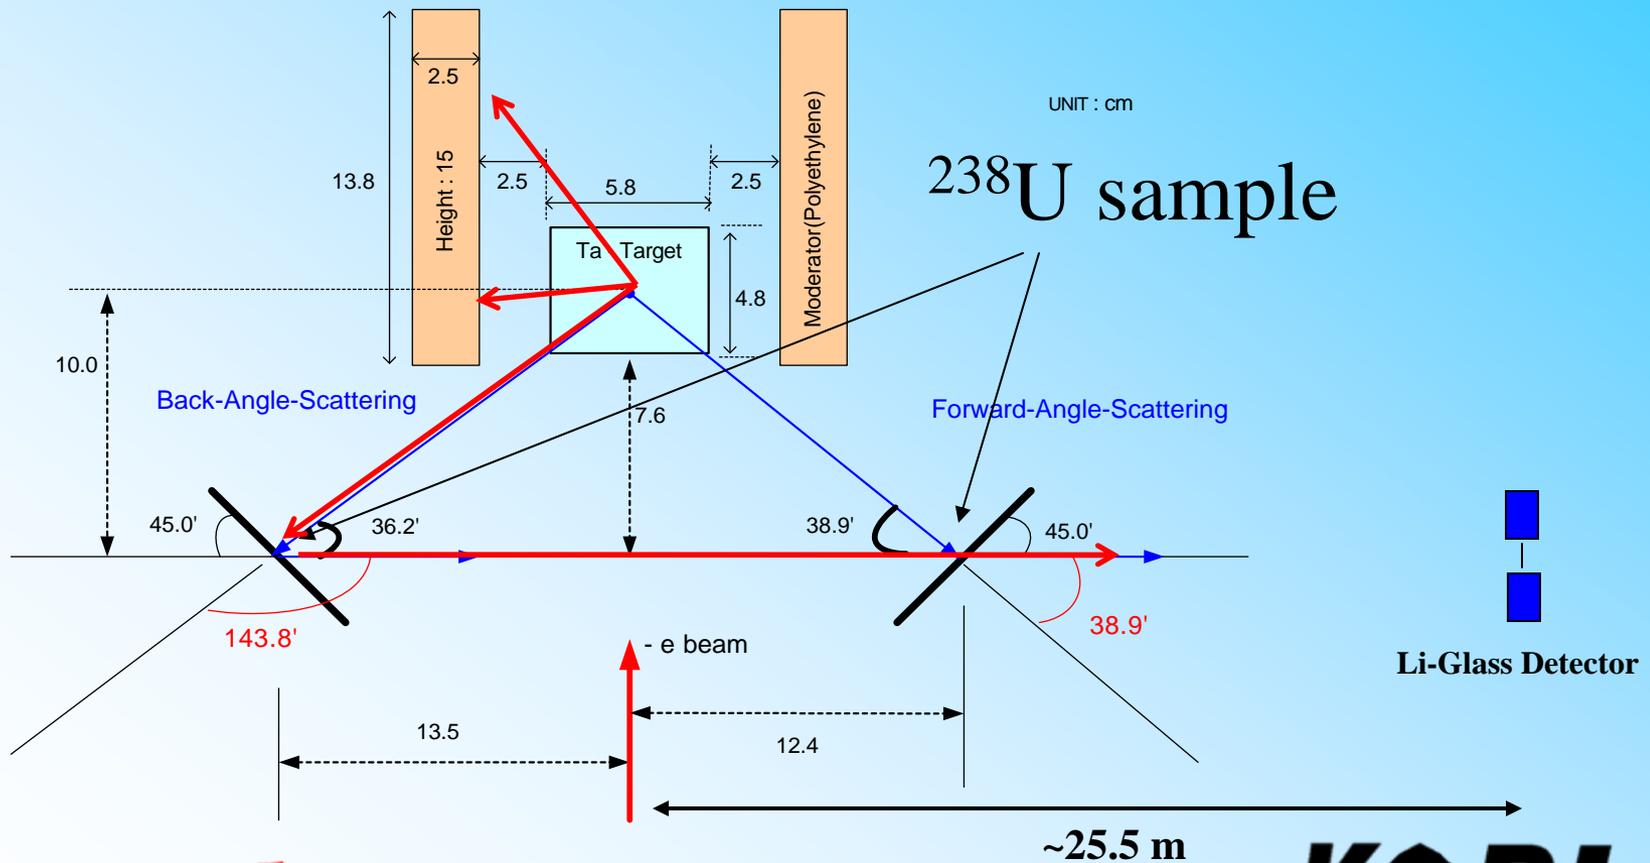

^{238}U Resonance Scattering

- Neutron scattering kinematics in the resonance region is normally treated as free gas.
- The derivation of the scattering kernel in most (if not all) Monte Carlo (MC) codes assumes a constant cross section
 - OK in the thermal region, but not for the low lying resonances.
- By default MCNP stops its approximated free gas model treatment at 400 kT (~ 10 eV). This can be easily overridden.
- We collaborated with Ron Dagan from Institut für Reaktorsicherheit (IRS) Forschungszentrum Karlsruhe, GmbH
 - Dagan et al. derived the resonance scattering kernel and implemented it in NJOY to create a scattering kernel $S(\alpha, \beta)$ for MCNP
- Together with a visiting scholar, *Dr. Tae-Ik Ro*, we performed experiments to validate this model.

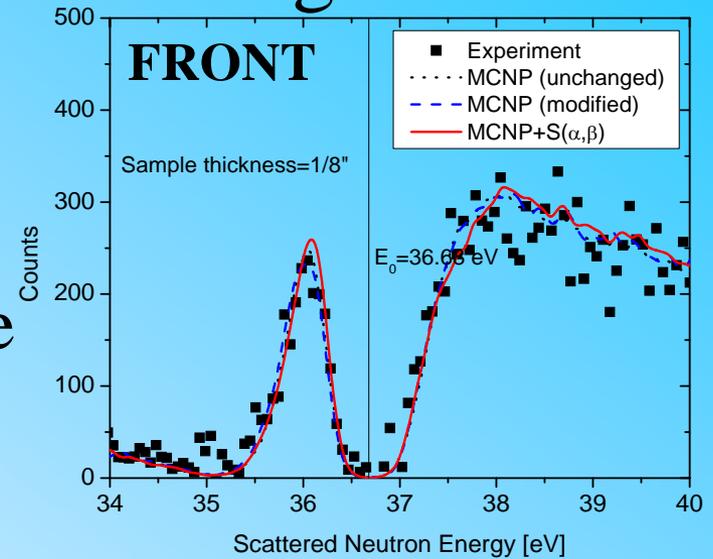

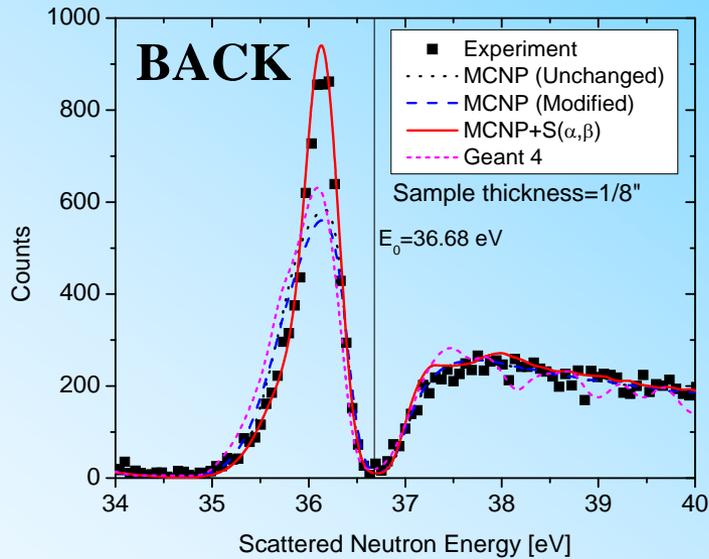

^{238}U Resonance Scattering Experimental Setup

- Compare forward to backward scattering from depleted ^{238}U samples

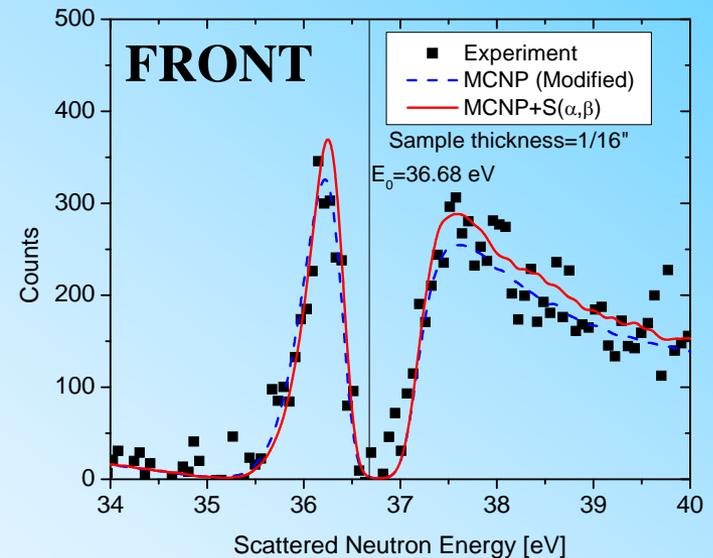

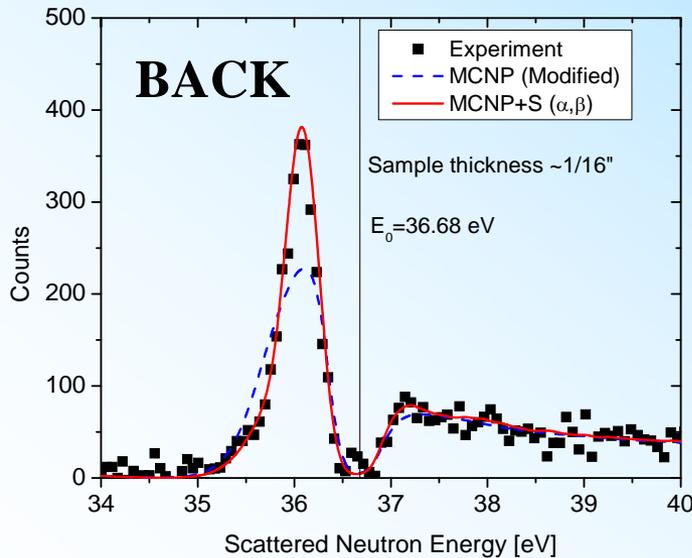

Results - ^{238}U Scattering

Thick Sample

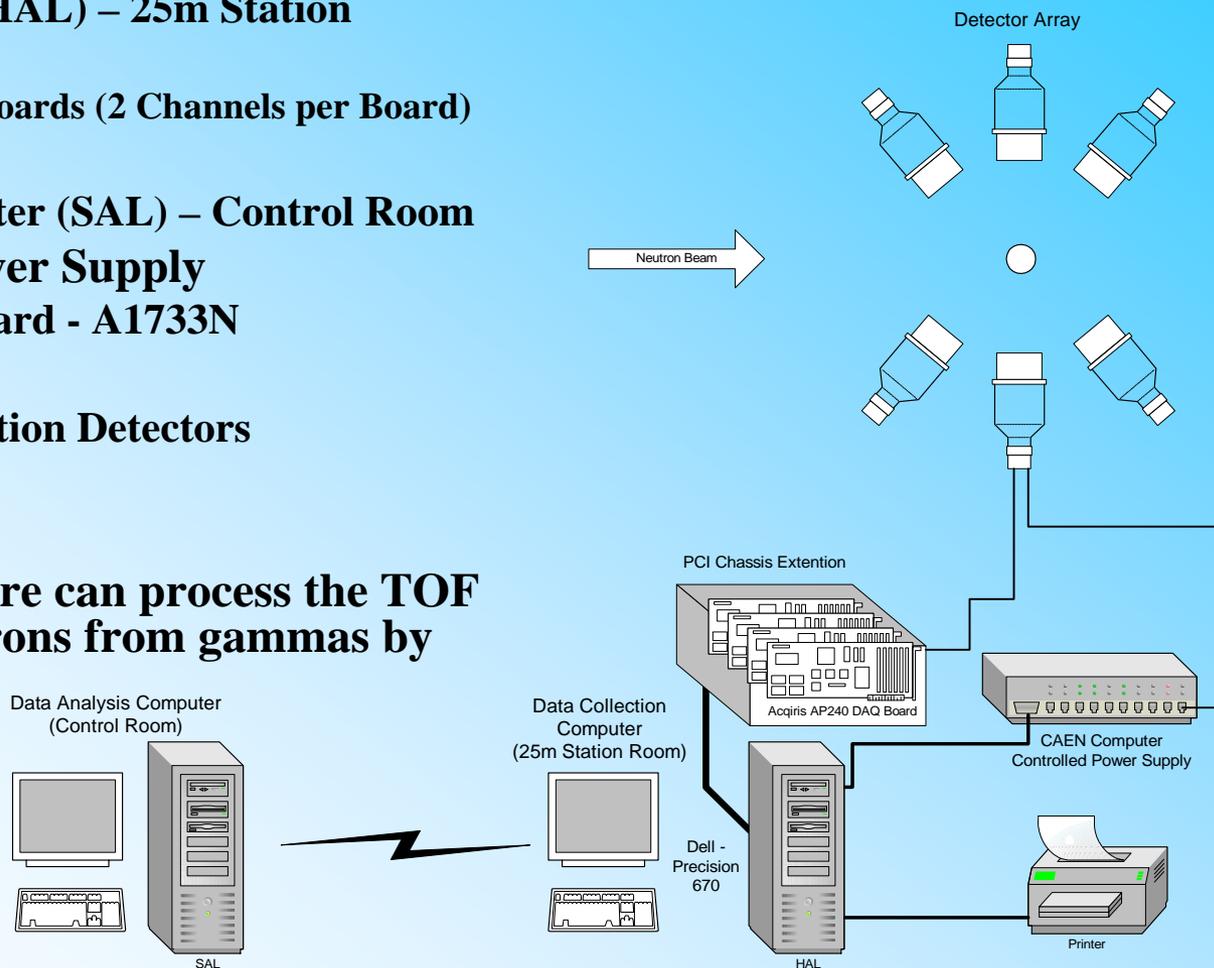

Thin Sample

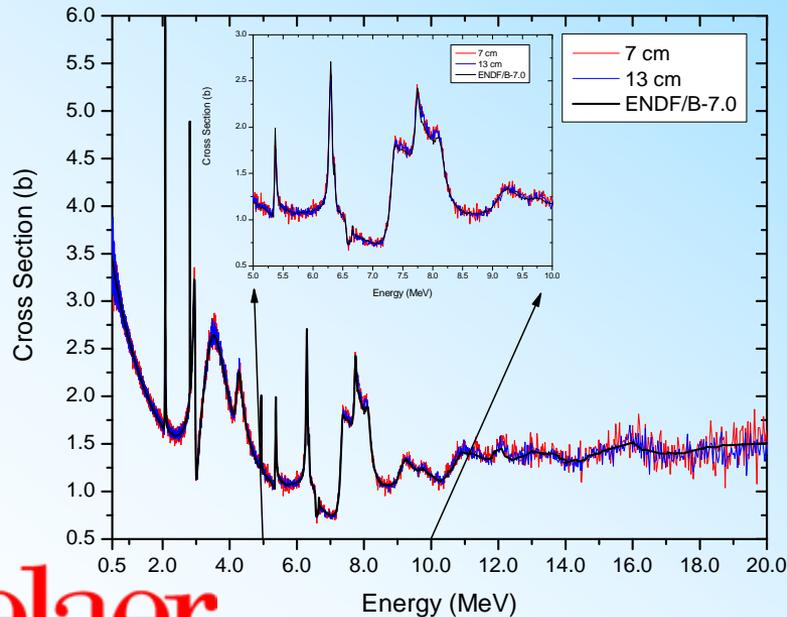

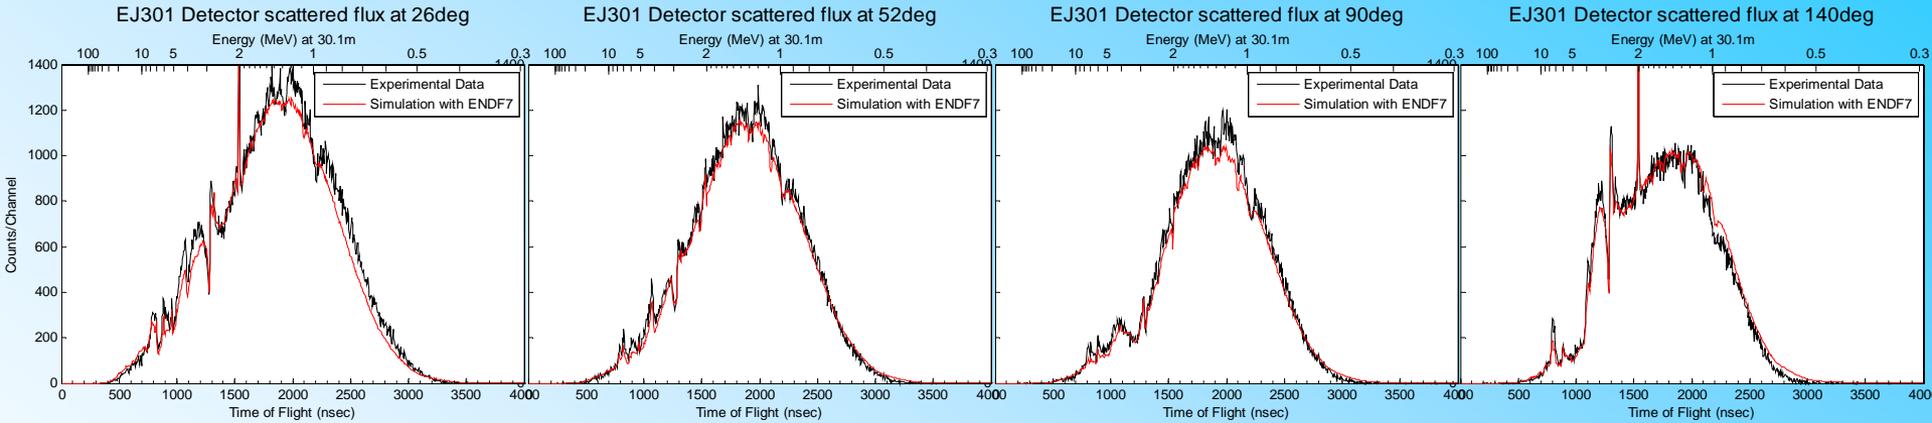

Scattering Detection System: Experimental Setup

- **Data Acquisition System**
 - Main DAQ Computer (HAL) – 25m Station
 - PCI Extension Chassis
 - Acqiris AP240 DAQ Boards (2 Channels per Board)
- **Data Processing System**
 - Data Processing Computer (SAL) – Control Room
- **Computer Controlled Power Supply**
 - Chassis - SY 3527 Board - A1733N
- **Detector Array**
 - 8 EJ301 Liquid Scintillation Detectors
 - Detector Stands
- **Sample Holder / Changer**
- **The RPI developed software can process the TOF data and distinguish neutrons from gammas by pulse shape analysis**

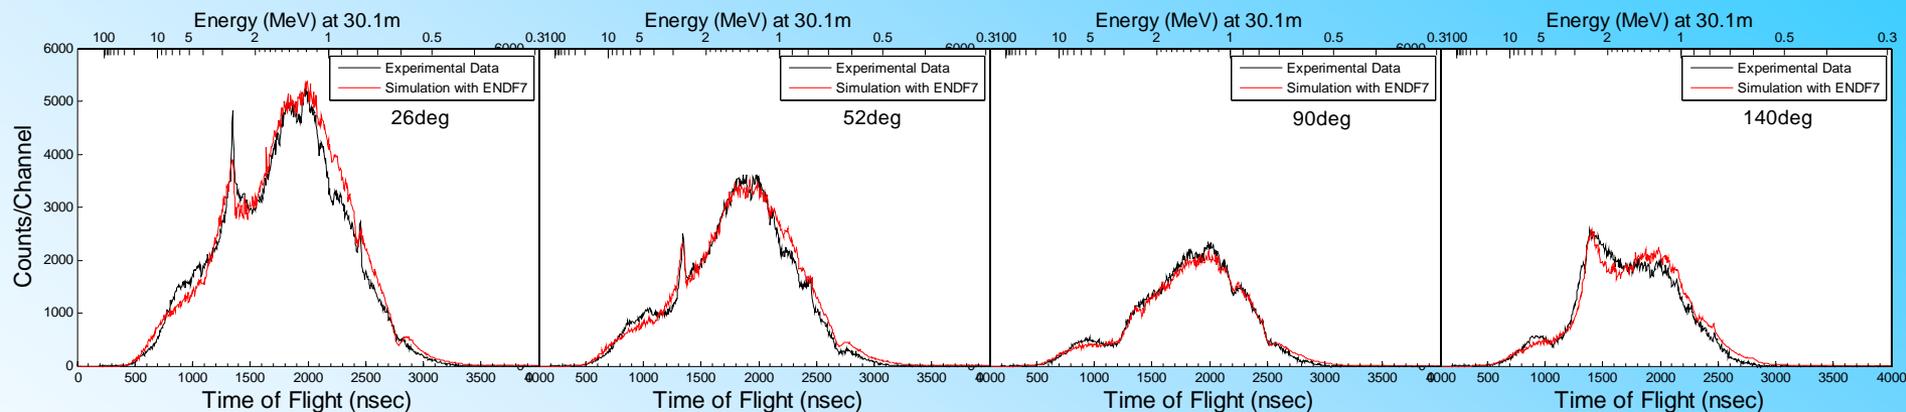

Carbon Experimental Results

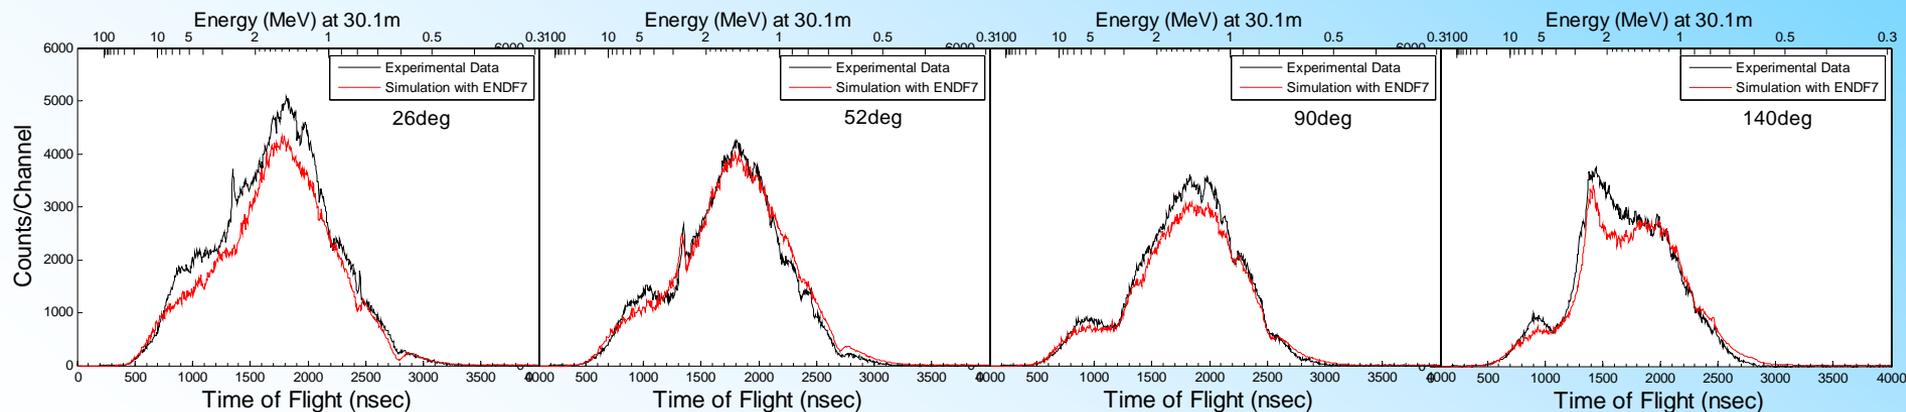

Total cross section

Beryllium Experimental Results

4cm

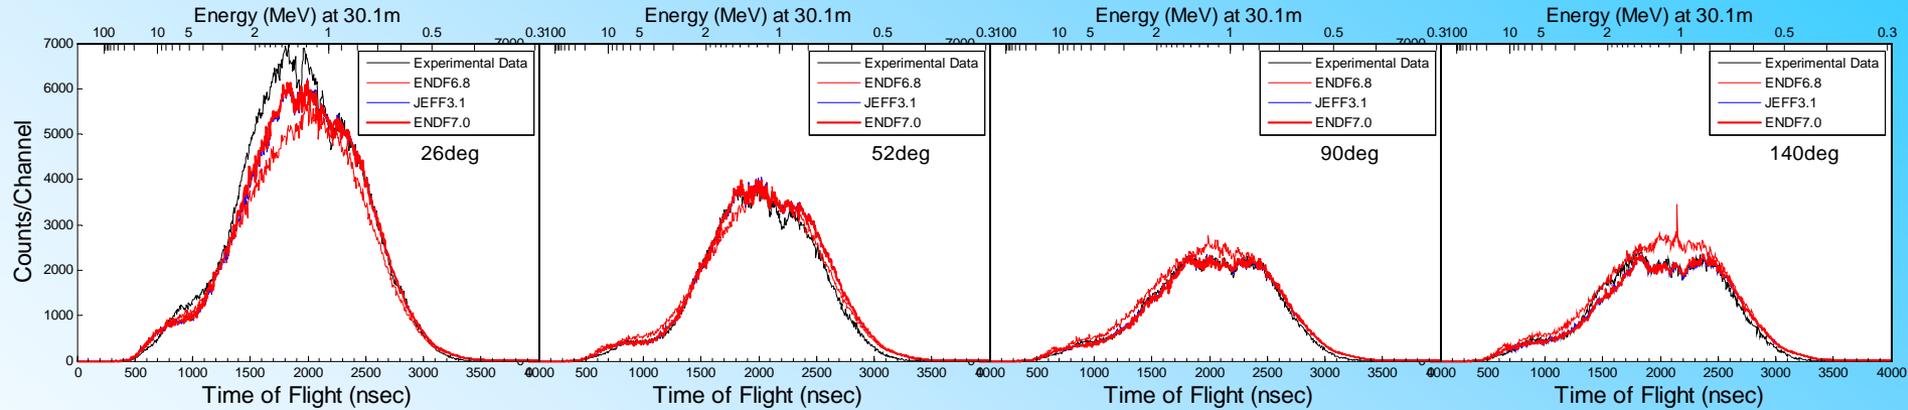

8cm

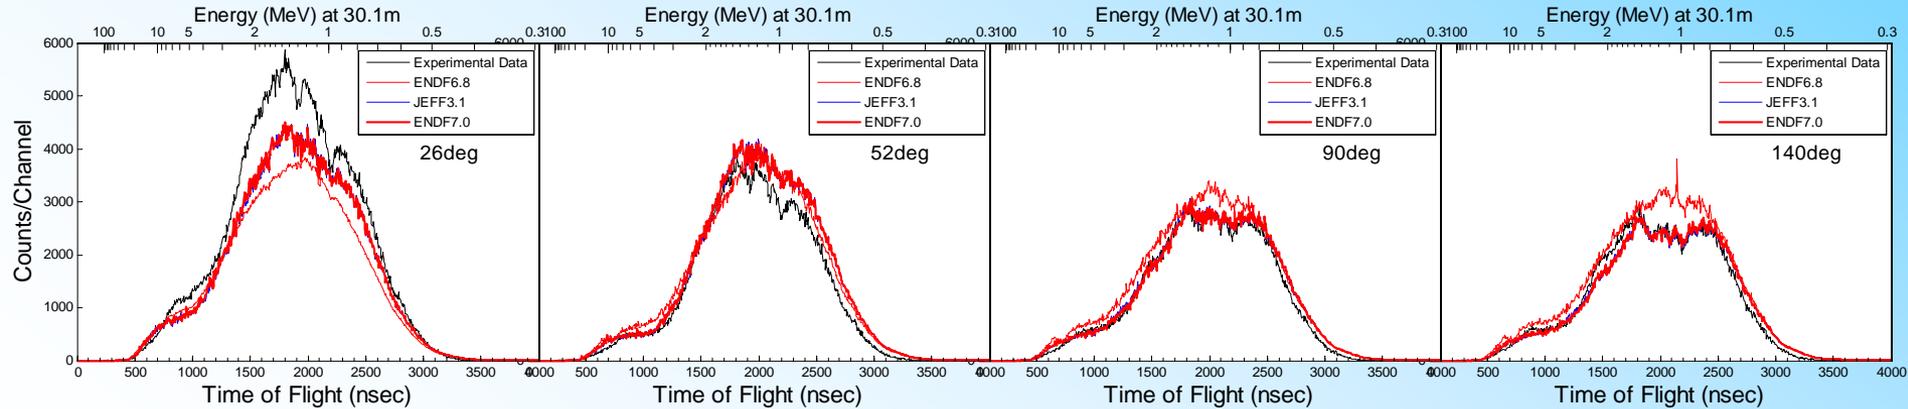

Molybdenum Experimental Results

5cm

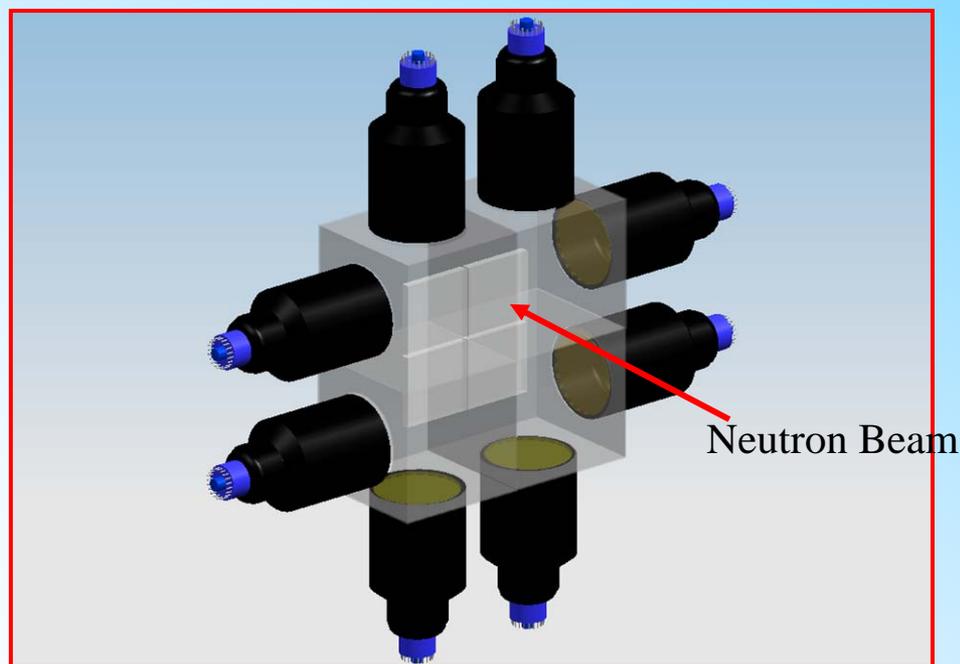

8cm

High Resolution Transmission Detector

- Modular Li-Glass detector will be positioned at 100m flight path
 - Extends our capabilities up to the unresolved resonance region
- Prototype module built and tested.

Lead Slowing Down Spectrometer

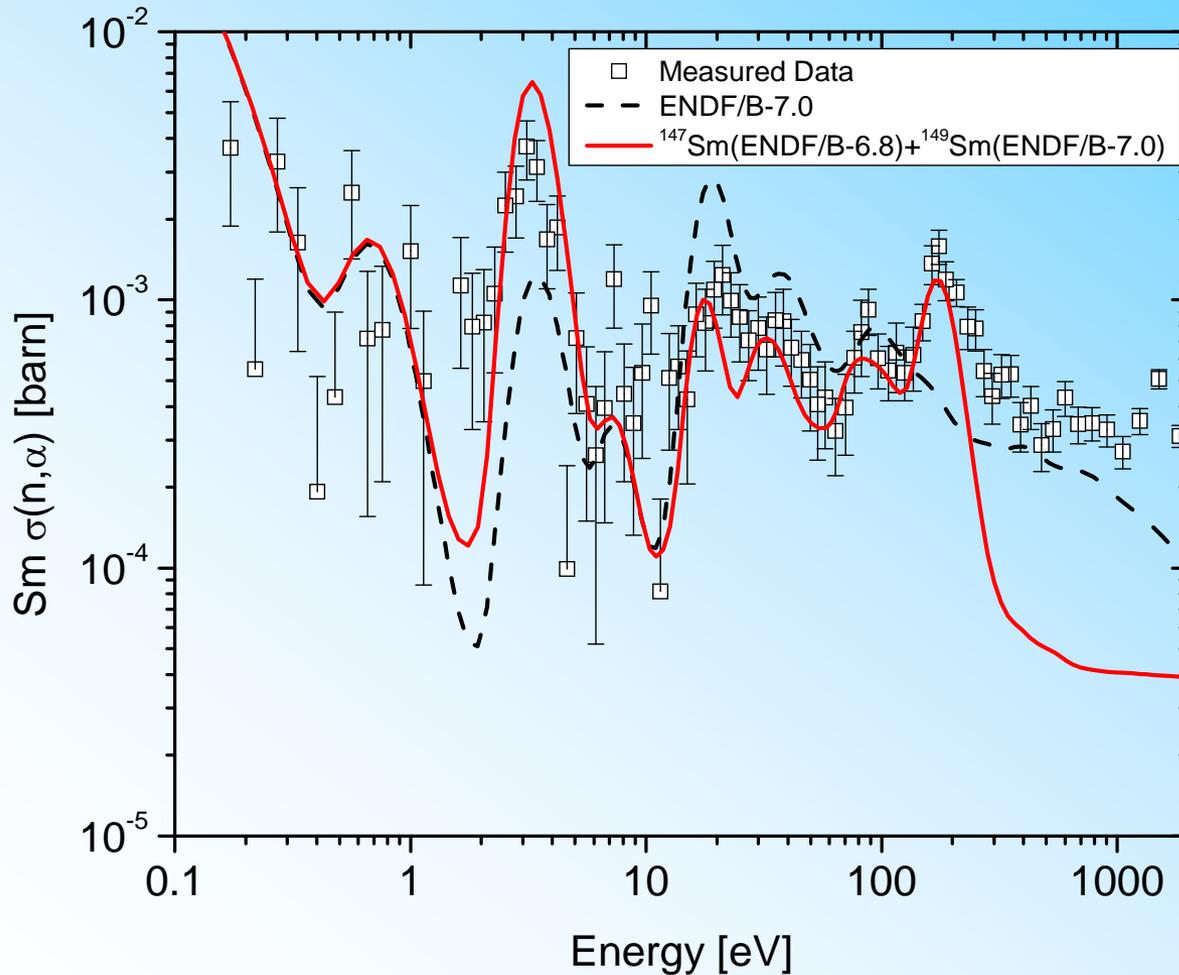

- Fission cross section and fission fragment spectroscopy
 - Measured ^{235}U and ^{239}Pu .
 - ^{248}Cm is planned.
 - Cathy Romano PhD topic.
- Detectors for (n, α) and (n,p) measurements are under development
 - Compensated Solar Cells
 - **Compensated PIPS detectors**
 - Compensated GEM amplified detectors (shown on the right)

Working hard with the LANL LSDS

Measurement of (n,α) cross section of Natural Sm

- The motivation was to demonstrate the ability to measure small cross section of small sample with the LSDS
- Possible contamination from ^{149}Sm (n,γ) was not corrected yet.
- Data were normalized to the evaluations.
- Best fit with ^{147}Sm from ENDF/B 6.8 and ^{149}Sm from ENDF/B-7.0
- The ^{147}Sm ENDF.B 6.8 evaluation is in better agreement with the recent ORNL (n,α) measurement.

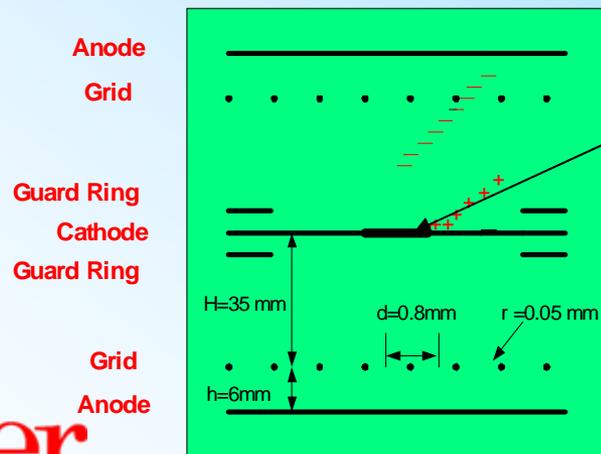

Paul E. Koehler et al. Phys. Rev. C 69,015803,2004

Simultaneous Measurements of Fission Cross Section and Fission Fragment Mass and Energy Distributions of Small Samples

- Use a double gridded fission chamber with the RPI LSDS
- Use kinematics to compute
 - Fragment angle relative to the normal to the sample
 - Fragment energy distribution
 - Fragment mass distribution

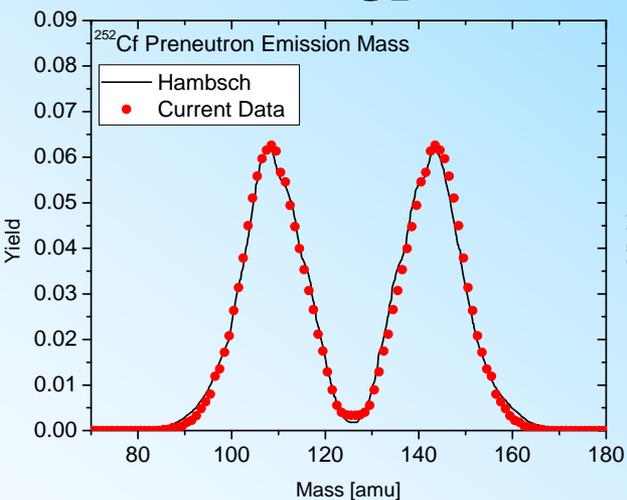

Sample

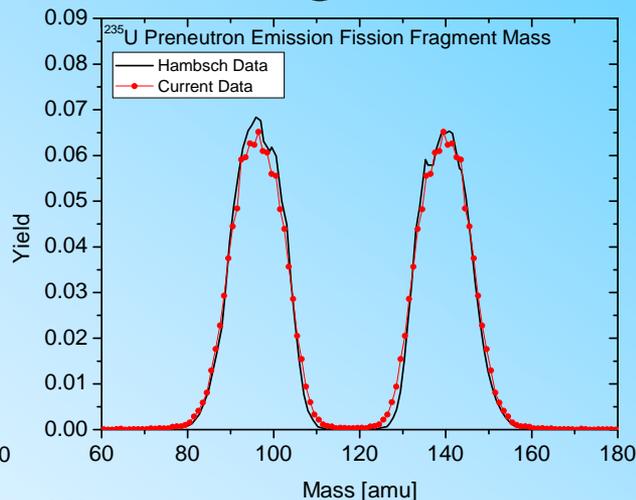

Results – Fission Fragment Mass distribution $E_n < 0.1$ eV

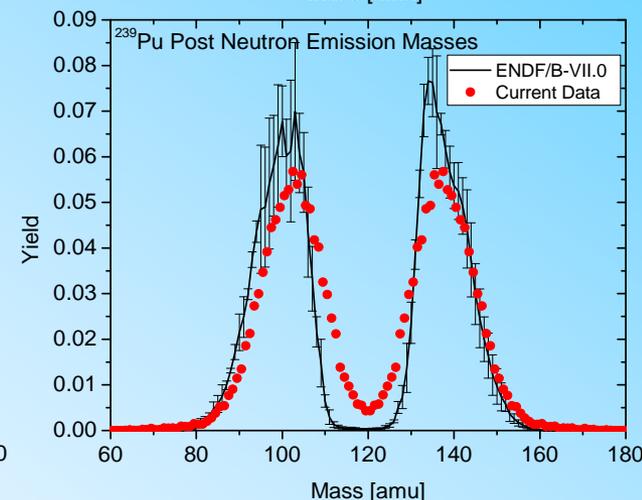

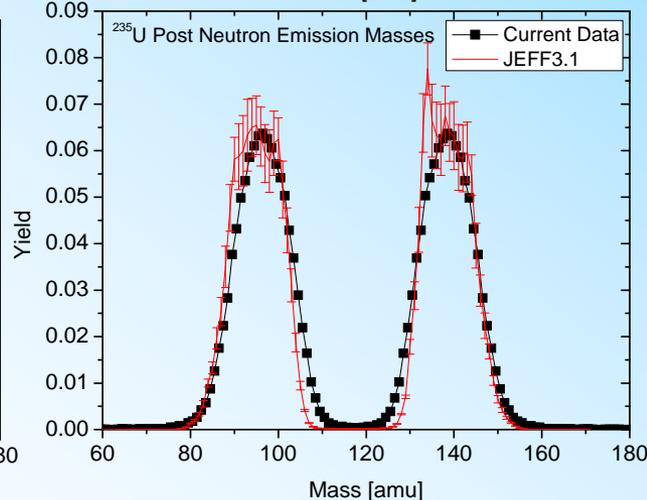

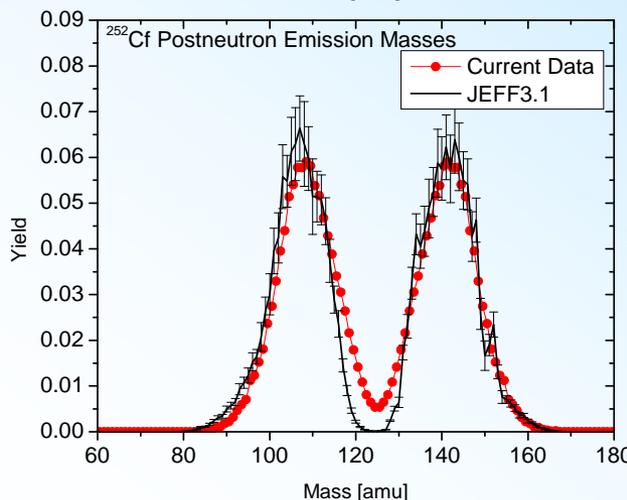

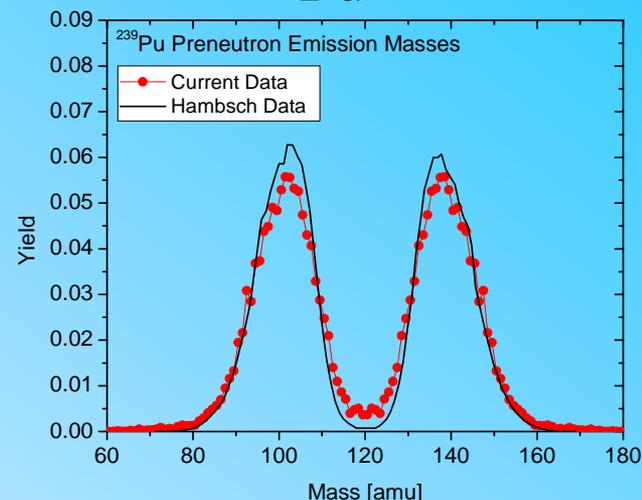

^{252}Cf

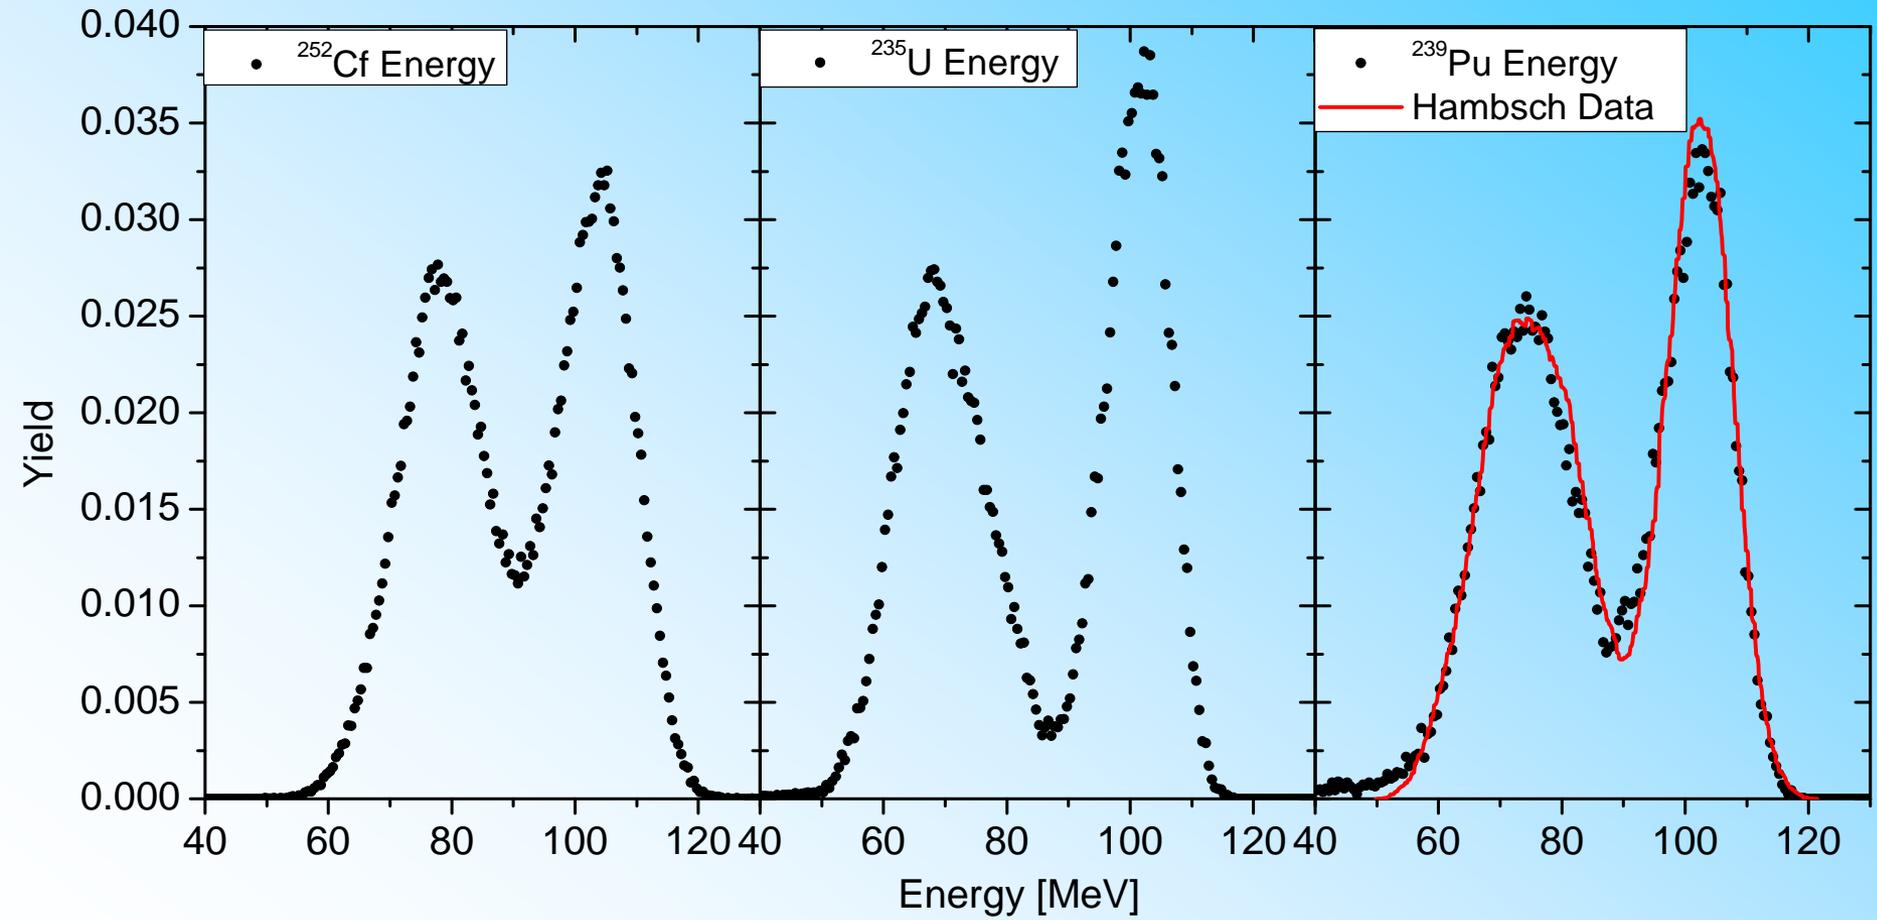

^{235}U

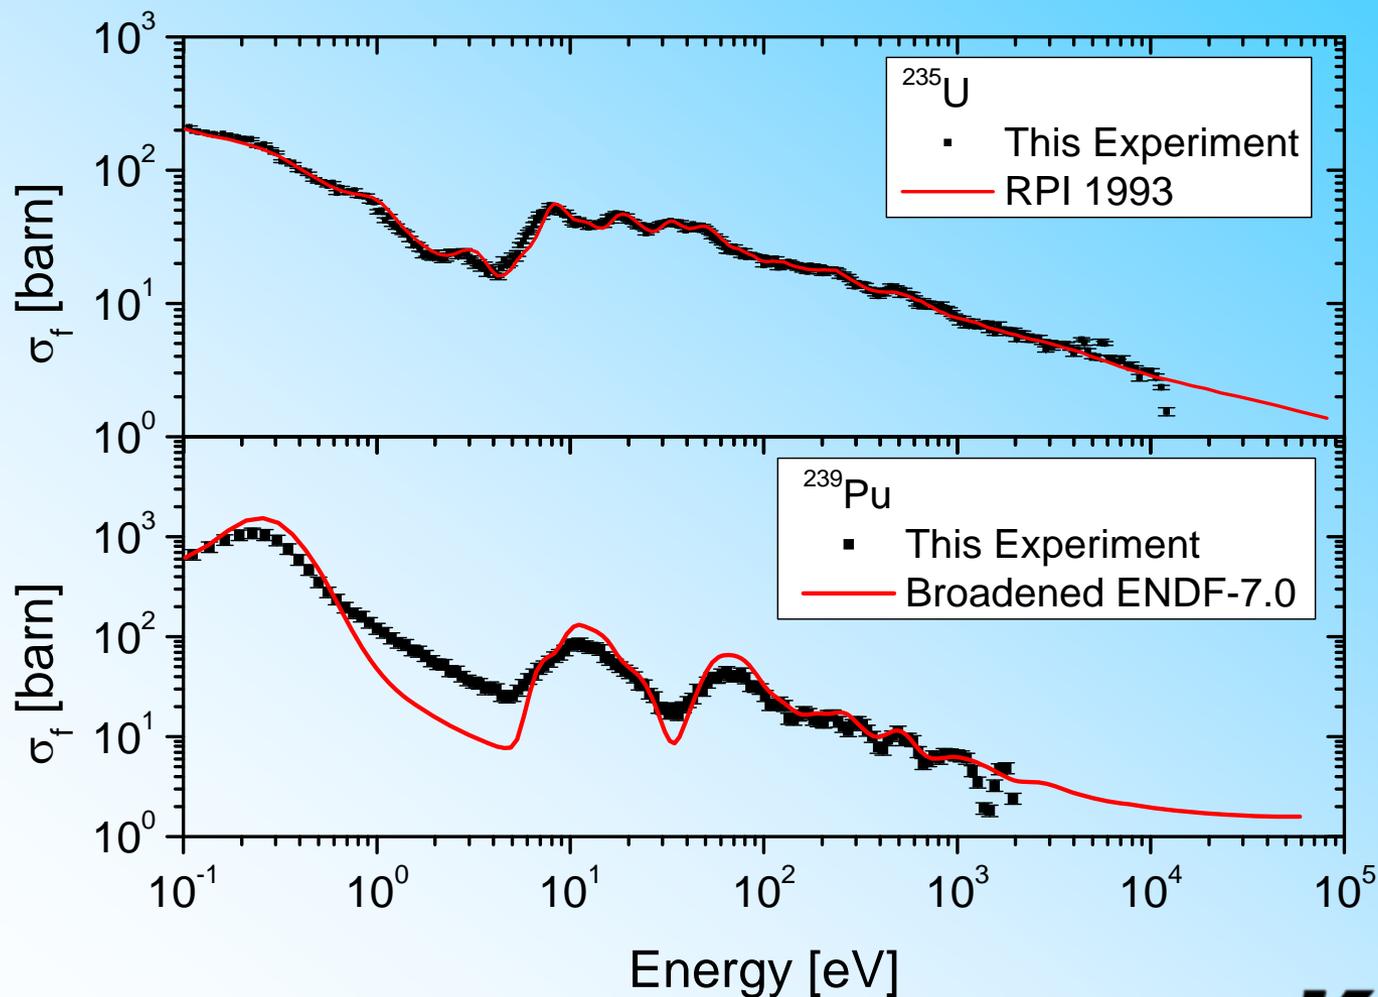

^{239}Pu

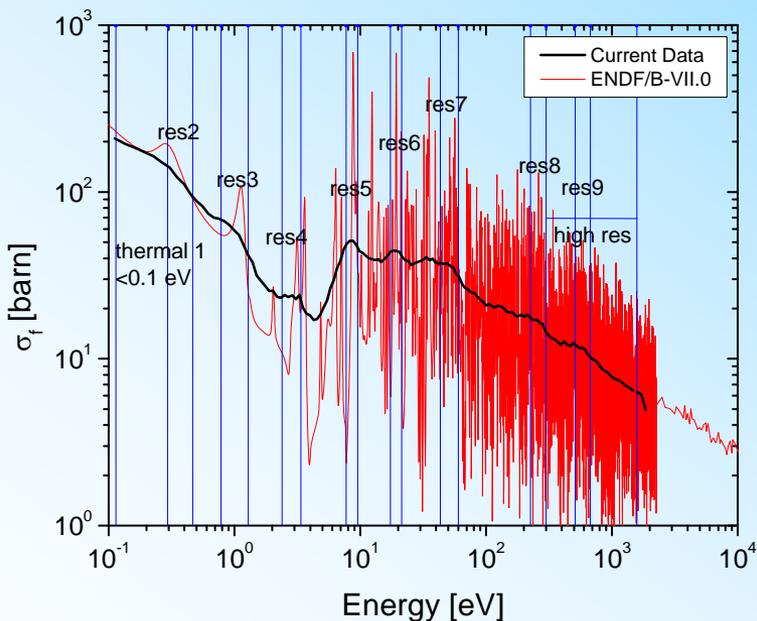

Results – Fission Fragment Energy Distribution $E_n < 0.1$ eV

Results – Measured Fission Cross Section

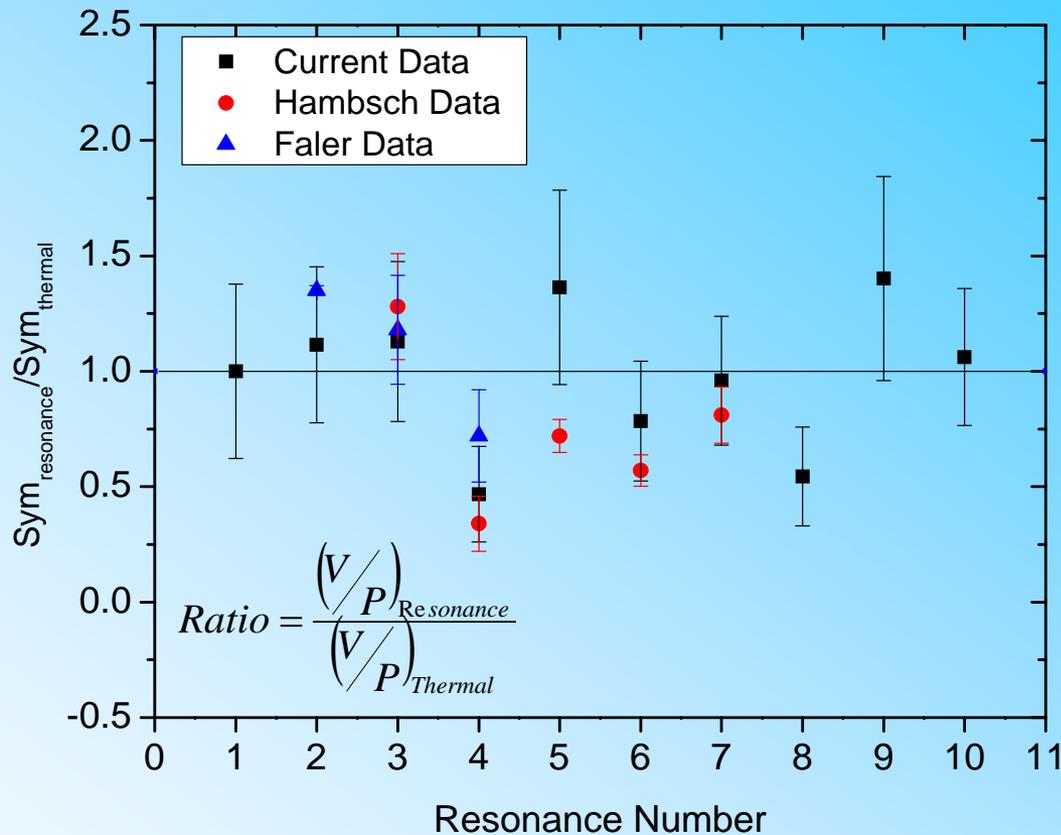

Fission symmetry in resonance clusters

Calculated with the pre neutron emission mass distribution

Symmetric Fission in Resonances Relative to Thermal

Summary

- Total cross section measurements for Zr and Ti from 0.5-20 MeV were completed
- Neutron scattering measurements for Mo and Be from 0.5-20 MeV were completed.
- Measurements of ^{238}U resonance scattering were completed.
- Measurements of ^{239}Pu fission fragment mass and energy distributions were completed.
- Measurement of (n,α) for natural samarium was accomplished at the LANL LSDS
- Analysis of Rh, Cd, Eu, ^{236}U and ^{164}Dy measurements is in progress
- Results for Mo resonance parameters were submitted for publication.
- Iron filtered beam measurement of Be total cross section was accepted for publication (Nuc Sci Eng).
- New transmission detector for high resolution resonance measurements is under construction.
