## Technical Meeting on Nuclear Data for Anti-neutrino Spectra and Their Applications

23-26 April 2019, IAEA Headquarters, Vienna, Austria

The Nuclear Data Section of the International Atomic Energy Agency is holding a Technical Meeting on Nuclear data for anti-neutrino spectra and their applications, from 23 to 26 April 2019.

The idea is to bring together experts from the broad spectrum of physics, theory and measurements, related to anti-neutrino studies for basic sciences (mixing angle in neutrino oscillations) and for applications (reactor monitoring with anti-neutrino detection), to review the current status of:

- neutrino anomalies and the sterile neutrino hypothesis
- existing measurements of integral beta spectra
- recent Daya Bay, Double Chooz and Reno results on spectra measurements
- results from short baseline experiments Prospect, SoLiD, Neutrino-4/DANSS, NEOS
- conversion method and uncertainties, corrections
- summation method and impact of nuclear data (beta decay data; fission yield data; uncertainties and correlations)
- nuclear data libraries (ENDF/B; JEFF; JENDL)

The goal is to (a) assess the sensitivity of the observations to uncertainties affecting large and short-baseline anti-neutrino measurements, (b) address the limitations and uncertainties of the theoretical methods (conversion vs summation), (c) estimate their dependence on the available data (beta spectra, decay data, fission yields), and finally (d) make recommendations for the existing measurements, theories and evaluations.

### Participants

Leendert Hayen

Jun Cao

Liangjian Wen

Yufeng Li

Zeyuan Yu

Fengpeng An

Liang Zhan

Cecile Jollet

Muriel Fallot

Madalina Wittel

Karl-Heinz Schmidt

Tadashi Yoshida

Soo-Bong Kim

Sunny Seo

Marek Karny

Marzena Wolinska

Dmitry Svirida

Alejandro Algorta

Jose Tain

Antonin Vacheret

Alejandro Sonzogni

Toshihiko Kawano

### Presentations

#	Author	Title
1	P. Dimitriou	Introduction
2	C. Jollet	Last Double Chooz results and observations with null nuclear power
3	B. Littlejohn	Daya Bay antineutrino flux measurements
4	L. Zhan	Daya Bay spectrum measurements
5	S.B. Kim	Precise Measurement of Reactor Antineutrino Yield and Spectrum at
6	J. Cao	TAO-JUNOS experiment
7	Y. Li	Global reactor flux analysis
8	J. Link	CHANDLER: A New Technology for Surface-level Reactor Neutrino D
9	S.-H. Seo	NEOS I & II
10	A. Vacheret	SoLiD
11	D. Svirida	DANSS experiment
12	K. Heeger	PROSPECT
13	N. Bowden	PROSPECT Applications
14	Y. Efremenko	Coherent elastic neutrino-nucleus scattering
15	P. Huber	Antineutrino spectrum prediction and nuclear data
16	A. Hayes	Current status of the reactor neutrino spectrum

### Antineutrino spectra and their applications

Summary of the Technical Meeting

IAEA Headquarters, Vienna, Austria

23-26 April 2019

Prepared by

M. Fallot  
Laboratoire SUBATECH-University of Nantes  
Nantes, France

B. Littlejohn  
Illinois Institute of Technology  
Chicago, USA

P. Dimitriou  
IAEA  
Vienna, Austria

# Historical background: starting in 2011

- New reference  $\bar{\nu}_e$  flux/spectra from conversion of ILL measured beta spectra: Mueller et al, Phys.Rev. C83(2011) 054615
- Converted  $\nu$  spectra =  $\sim +3\%$  normalization shift with respect to old  $\bar{\nu}_e$  spectra (235U, 239Pu, 241Pu)  $\rightarrow$  flux anomaly

G. Mention et al. Phys. Rev. D83, 073006 (2011)

- Spectral distortion discovered in addition to flux deficit
- “Hunt” for sterile neutrinos to explain ‘reactor anomaly’: 6% deficit in flux, “bump” at 5-7 MeV
- In addition to campaigns to measure  $\theta_{13}$  oscillation parameter
- Results from first campaigns:

Y. Abe et al Phys. Rev. LeO. 108, 131801, (2012) *Double Chooz*

F. P. An et al., Phys. Rev. LeO. 108, 171803 (2012) *Daya Bay*

J. K. Ahn et al., Phys. Rev. LeO. 108, 191802 (2012) *Reno*

# Goals of the meeting

- Bring together representatives of major collaborations and groups from all over the world to discuss
  - Achievements and outstanding issues of measurements of reactor anti-neutrino flux and spectrum
  - Status of calculations of reactor anti-neutrino flux and spectrum [Conversion method, Summation method]
  - Impact of nuclear data, nuclear theory and reactor parameters
  - Make recommendations for future

## Verify Operational Status

## RENO

## Double Chooz

## Daya Bay

# Broad international participation

## 35 participants from 11 countries incl. IAEA

---

Reactor anti-neutrino measurements: representatives of almost all long- and short-baseline experiments attended

---

Reactor anti-neutrino flux and spectrum calculations

---

Nuclear data and theory: experimental groups and evaluators/theorists attended

---

Reactor parameters: the importance of collaborating with the nuclear reactor engineers was recommended at the meeting

Daya Bay, Double Chooz, NEOS, RENO, TAO-JUNOS, PROSPECT, SoLiD, DANSS, CHANDLER, COHERENT

Conversion method, Summation method experts

Decay data, TAGS, Fission Product Yields, beta-decay theory (first forbidden non-unique transitions)

In future meetings

# Meeting Photo

# Structure of the meeting

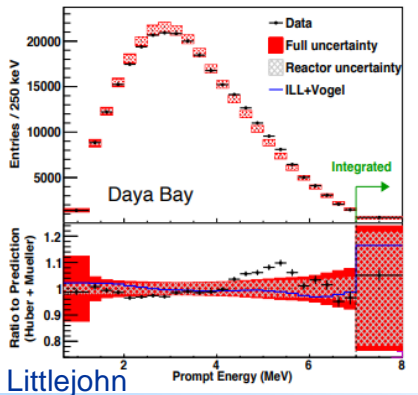

- Chair: A. Sonzogni  
Rapporteurs: M. Fallot, B. Littlejohn
- Presentations: 2.5 days (28 presentations)
  - ample time for Q&A
- Roundtable Discussions: 2 days
  - 2 moderators: experiments - K. Heeger, calculations - P. Huber
  - Preparation of questions and discussion items
  - Minutes – joint statement including recommendations (B. Littlejohn, M. Fallot)
- Summary report: based largely on the Minutes INDC(NDS)-0786  
(download from meeting webpage)

# Measurement of reactor $\bar{\nu}_e$ flux and spectrum

## Achievements

- Precision measurements at LEU – systematics limited
- Modern measurements at HEU – statistics limited
- Demonstrated technology and capability of precision IBD measurements with surface-based detectors
- Coherent neutrino scattering allows detection of  $\bar{\nu}_e$  with larger cross sections
- Ongoing R&D efforts towards surface based, field deployable, high signal-to-background detectors

Littlejohn

$N^2$  dependence of the CEvNS cross section.

WoN

# Measurement of reactor $\bar{\nu}_e$ flux and spectrum

## • Outstanding issues

- Origin of ‘bump’ in  $\bar{\nu}_e$  spectra measured at LEU STILL NOT KNOWN
- eV-scale sterile neutrinos still to be tested
- Isotopic  $\bar{\nu}_e$  yields and spectrum uncertainties are unknown at the level of several percent
- Possible indication of fine structure
- No measurements below IDB threshold 1.8 MeV
- Secondary contributions from spent fuel, samarium poisoning, non-equilibrium and non-linear isotopes, not measured
- Only LEU and HEU measurements
- Not all published  $\bar{\nu}_e$  data and supplementary materials are available in tabulated electronic form
- Up-to-date summation antineutrino models are not easily accessible for use by neutrino experimentalists

Shape-only data to prediction comparison

# Future $\bar{\nu}_e$ measurements

- High-resolution and high-precision measurements at LEU over several fuel cycles (preferably single reactor)
  - Reference spectrum
  - Benchmark for nuclear databases
  - Reliable isotopic IBD yields
  - Improve nuclear physics models for neutron-rich nuclides
- Deploy similar mobile detector systems at multiple reactor types (precision measurements)
  - library of templates for different reactor types useful for safeguards and reactor monitoring
  - validated technologies for safeguards and reactor monitoring
  - opportunity to validate model predictions for different reactor types and fissile vectors
- Perform measurements of spectrum below 1.8 MeV using coherent nuclear or electron scattering
  - New information for  $\bar{\nu}_e$ , nuclear and reactor models

# Data standardization and dissemination

- Establish standard plots and formats for flux/spectrum data and inputs
- Encourage use of peer-reviewed, published data and results with tabulated data and supplementary materials references
- Establish standards, processes and locations for permanent public storage and access

# Calculations of $\bar{\nu}_e$ flux and spectrum

## • Conversion method

[relies on single measurement of the integral beta spectrum of  $^{235}\text{U}$ ,  $^{239}\text{Pu}$ ,  $^{241}\text{Pu}$  by Schreckenbach et al. at ILL, 1980s; beta decay models]

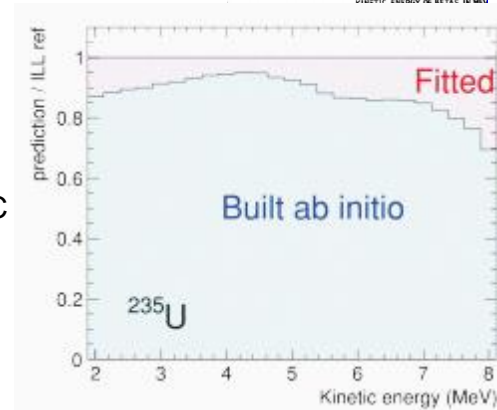

- use of nuclear data for realistic beta branches, Z distribution of the branches
- Th.A. Mueller et al, Phys.Rev. C83(2011) 054615;  
P. Huber, Phys.Rev. C84 (2011) 024617

## • Summation method

[relies on nuclear data: decay data, fission yield data]

- First summation calculations: B.R. Davis et al. Phys. Rev. C 19 2259 (1979), to Tengblad et al. Nucl. Phys. A 503 (1989)136
- First TAGS measurements: Greenwood et al, 1980s

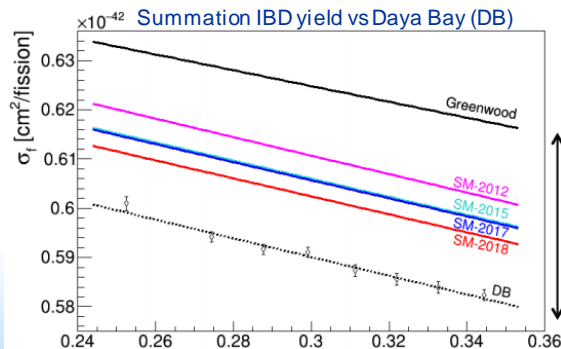

# Achievements

- Conversion and Summation method agree in spectral shape in 2-5 MeV
- Disagreement wrt measured at 2-5 MeV - 'bump' not explained (yet reduced)
- Differences between measured IBD yield and Summation dropped from 7% to 2%

A. C. Hayes et al. PRL 120 (2018) 022503

6% (Greenwood TAGS, ~Hub)

3% (+TAGS 2012, ~&lt; Hayes et al. 3.5%)

2.4% (+TAGS 2015 &amp; 2017)

1.9% (+ TAGS 2018)

# Major factor has been effort in nuclear data

- Total Absorption Gamma-ray Spectroscopy (TAGS) combined with High-Resolution Gamma-ray Spectroscopy (HRGS)

Pandemonium (The Capital of Hell)  
introduced by John Milton (XVII) in his epic poem Paradise Lost

*About 100 decays have been measured since 2010:*

Nantes-SUBATECH group: Fallot et al.

IFIC-Valencia: Algora, Tain et al.

ORNL- Univ. Warsaw: Ryksaczewski, Karny et al.

+

**HRGS @ ANL:**

**Decay Data for anti-neutrino applications (ATLAS & CARIBU)**  
(F. Kondev et al.)

MTAS at ORNL

DTAS (IFIC-Valencia)

*Priority TAGS lists have been covered extensively:*

A. A. Sonzogni, E. A. McCutchan, and A. C. Hayes Phys. Rev. Lett. 119, 112501

IAEA Meetings: TAGS measurements for decay heat AND anti-neutrino spectra calculations, INDC(NDS)-676

# Outstanding issues I

- Conversion method: correct treatment of uncertainties (previously underestimated)
  - Average spread of effective  $Z$
  - Treatment of high- $Q$  non-unique forbiddenness
  - Other corrections (weak magnetism etc.)
- Integral data: basis of all flux models remains the single measurement of integral beta spectra by Schreckenbach et al (1980s):

***Recommendation:* new measurements of the integral beta energy spectra for the main actinides**

# Outstanding issues II

- Summation method: realistic estimates of the uncertainties including correlations
  - Fission yield data: improve measurements, theory and evaluations

## *IAEA Coordinated Research project on Updated Fission Yields for Applications (2020-2024)*

- Non-unique forbidden transitions (shape factors): need to improve the models
  - New models should be validated against measured shape factors
  - New measurements of shape factors are needed [targeted lists exist]
- Beta-decay theory: improving predictive power to complement evaluated data in the absence of experimental data

# Outstanding issues III

- Reactor parameters:
  - Non-equilibrium effects, structural aluminium, Sm poisoning of the reactor core
  - Energy release per fission: discrepancies between calculated and literature values
  - Impact of different fuels (MOX, VTR)

***Recommendation:*** to engage reactor physicists/engineers in discussions and meetings

# General concluding remarks

- The meeting brought together experts from reactor neutrino experimental groups, theory/data groups applying the conversion and summation methods, nuclear theory, experimental nuclear physics and nuclear data

*Belgium, China, France, Germany, Japan, Korea, Poland, Russia, Spain, UK, USA,*

*Discussions benefited from international coordination*

# Recommendations to IAEA

- Create an international working group (Antineutrino Flux Working Group)

## Scope:

- standardized antineutrino data
  - standardized models
  - Antineutrino model input nuclear data and experiment
- Hold similar meetings every 2 years

# Future

- Follow-up IAEA Technical Meeting in 2022
  - Technical advances
  - International working group
  - Standardization, data storage and access

**IAEA**
